

Cyanovirin-N

Cyanovirin-N, also known as CV-N, is a type of medicine called a fusion inhibitor. Fusion inhibitors work by preventing HIV from entering human cells.

CV-N is being studied as a microbicide. Microbicides are substances that protect the body from infection by microorganisms such as bacteria, viruses, and fungi. Microbicides work by either destroying the microbes or preventing them from establishing an infection.

HIV/AIDS-Related Uses

CV-N is an investigational medicine that is not yet approved by the FDA for use outside of clinical trials. It is being studied for the prevention of sexual transmission of HIV infection. This medicine does not cure or prevent HIV infection or AIDS and does not reduce the risk of passing the virus to other people.

Dosage Information

CV-N is designed for use inside the vagina.

Contraindications

Individuals should tell a doctor about any medical problems before taking this medicine.

Possible Side Effects

Along with its desired effects, CV-N may cause some unwanted effects. In laboratory studies, CV-N has not been harmful to human cells. However, CV-N has not yet been studied in clinical trials, and its side effects are not known.

Drug and Food Interactions

A doctor should be notified of any other medications being taken, including prescription, nonprescription (over-the-counter), or herbal medications.

Clinical Trials

For information on clinical trials that involve Cyanovirin-N, visit the ClinicalTrials.gov web site at <http://www.clinicaltrials.gov>. In the Search box, enter: Cyanovirin-N AND HIV Infections.

Manufacturer Information

Cyanovirin-N
Biosyn, Inc.
1800 Byberry Road, Building 13
Huntingdon Valley, PA 19006-3525
