Table 1. Prophylaxis to Prevent First Episode of Opportunistic Disease  
(Last updated March 28, 2019; last reviewed March 28, 2019)

<table>
<thead>
<tr>
<th>Opportunistic Infections</th>
<th>Indication</th>
<th>Preferred</th>
<th>Alternative</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coccidioidomycosis</td>
<td>A new positive IgM or IgG serologic test in patients who live in a disease-endemic area and with CD4 count &lt;250 cells/µL (BIII)</td>
<td>Fluconazole 400 mg PO daily (BIII)</td>
<td></td>
</tr>
<tr>
<td>Hepatitis A Virus (HAV) Infection</td>
<td>HAV-susceptible patients with chronic liver disease, or who are injection-drug users, or MSM (AII). IgG antibody response should be assessed 1 month after vaccination; non-responders should be revaccinated when CD4 count &gt;200 cells/µL. (BIII).</td>
<td>Hepatitis A vaccine 1 mL IM x 2 doses at 0 and 6–12 months (AII).</td>
<td>For patients susceptible to both HAV and hepatitis B virus (HBV) infection (see below): Combined HAV and HBV vaccine (Twinrix®), 1 mL IM as a 3-dose (0, 1, and 6 months) or 4-dose series (days 0, 7, 21 to 30, and 12 months) (AII)</td>
</tr>
</tbody>
</table>
### Table 1. Prophylaxis to Prevent First Episode of Opportunistic Disease

<table>
<thead>
<tr>
<th>Opportunistic Infections</th>
<th>Indication</th>
<th>Preferred</th>
<th>Alternative</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hepatitis B Virus (HBV) Infection</td>
<td>• Patients without chronic HBV or without immunity to HBV (i.e., anti-HBs &lt;10 international units/mL) <em>(AII)</em>&lt;br&gt;• Vaccination is recommended before CD4 count falls below 350 cells/µL <em>(AII)</em>.&lt;br&gt;• In patients with CD4 counts 350 cells/µL, vaccination should not be deferred until CD4 count reaches &gt;350 cells/µL, because some patients with CD4 counts &lt;200 cells/µL do respond to vaccination <em>(AII)</em>.</td>
<td>• HBV vaccine IM (Engerix-B 20 µg/mL or Recombivax HB 10 µg/mL), 0, 1, and 6 months <em>(AII)</em>, or&lt;br&gt;• HBV vaccine IM (Engerix-B 40 µg/mL or Recombivax HB 20 µg/mL), 0, 1, 2 and 6 months <em>(BI)</em>,&lt;br&gt;• Vaccine conjugated to CpG (Heplisav-B®) IM at 0 and 1 months <em>(CIII)</em> – a 2-dose series can only be used when both doses given are Heplisav-B®.&lt;br&gt;• Combined HAV and HBV vaccine (Twinrix®), 1 mL IM as a 3-dose (0, 1, and 6 months) or 4-dose series (days 0, 7, 21 to 30, and 12 months) <em>(AII)</em></td>
<td>Some experts recommend vaccinating with 40-µg doses of either HBV vaccine <em>(CIII)</em>.</td>
</tr>
</tbody>
</table>

**Vaccine Non-Responders:**<br>• Anti-HBs <10 international units/mL 1 month after vaccination series<br>• For patients with low CD4 counts at time of first vaccine series, some experts might delay revaccination until after a sustained increase in CD4 count with ART *(CIII)*.<br>Re-vaccinate with a second vaccine series *(BIII)* | • HBV vaccine IM (Engerix-B 40 µg/mL or Recombivax HB 20 µg/mL), 0, 1, 2 and 6 months *(BI)*. |
<table>
<thead>
<tr>
<th>Opportunistic Infections</th>
<th>Indication</th>
<th>Preferred</th>
<th>Alternative</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Histoplasmosis</strong></td>
<td>CD4 count ≤150 cells/µL and at high risk because of occupational exposure or live in a community with a hyperendemic rate of histoplasmosis (&gt;10 cases/100 patient-years) (BI)</td>
<td>Itraconazole 200 mg PO daily (BI)</td>
<td></td>
</tr>
<tr>
<td><strong>Human Papillomavirus (HPV) Infection</strong></td>
<td>Females and males aged 13–26 years (AIII)</td>
<td>• HPV recombinant vaccine 9 valent (Types 6, 11, 16, 18, 31, 33, 45, 52, 58) 0.5 mL IM at 0, 1–2, and 6 months (AIII)</td>
<td>For patients who have completed a vaccination series with the recombinant bivalent or quadrivalent vaccine, many experts would give an additional full series of recombinant 9-valent vaccine, but there are no data to define who might benefit or how cost effective this approach might be (CIII).</td>
</tr>
<tr>
<td><strong>Influenza A and B Virus Infection</strong></td>
<td>All HIV-infected patients (AIII)</td>
<td>Inactivated influenza vaccine annually (per recommendation for the season) (AIII)</td>
<td>Live-attenuated influenza vaccine is contraindicated in HIV-infected patients (AIII).</td>
</tr>
<tr>
<td><strong>Malaria</strong></td>
<td>Travel to disease-endemic area</td>
<td>Recommendations are the same for HIV-infected and HIV-uninfected patients. Recommendations are based on region of travel, malaria risks, and drug susceptibility in the region. Refer to the following website for the most recent recommendations based on region and drug susceptibility: <a href="http://www.cdc.gov/malaria/">http://www.cdc.gov/malaria/</a>.</td>
<td></td>
</tr>
</tbody>
</table>
| **Mycobacterium avium Complex (MAC) Disease** | For CD4 Count <50 cells/mm³  
• Not recommended for those who immediately initiate ART (AII).  
• Recommended for those who are not on fully suppressive ART, after ruling out active disseminated MAC disease (AI). | • Azithromycin 1200 mg PO once weekly (AI), or  
• Clarithromycin 500 mg PO BID (AI), or  
• Azithromycin 600 mg PO twice weekly (BIII) | Rifabutin (dose adjusted based on concomitant ART)¹ (BI); rule out active TB before starting rifabutin. |
### Table 1. Prophylaxis to Prevent First Episode of Opportunistic Disease (page 4 of 6)

<table>
<thead>
<tr>
<th>Opportunistic Infections</th>
<th>Indication</th>
<th>Preferred</th>
<th>Alternative</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mycobacterium tuberculosis (TB) Infection</strong> (i.e., treatment of latent TB infection [LTBI])</td>
<td>(+) screening test for LTBI, with no evidence of active TB, and no prior treatment for active TB or LTBI (AI), or Close contact with a person with infectious TB, with no evidence of active TB, regardless of screening test results (AII).</td>
<td>(INH 300 mg + pyridoxine 25–50 mg) PO daily x 9 months (AII), or INH 900 mg PO BIW (by DOT) + pyridoxine 25–50 mg PO daily x 9 months (BII).</td>
<td>Rifampin 600 mg PO daily x 4 months (BIII), or Rifabutin (dose adjusted based on concomitant ART) x 4 months (BIII), or [Rifapentine (see dose below) PO + INH 900 mg PO + pyridoxine 50 mg PO] once weekly x 12 weeks rifapentine dose: 32.1 to 49.9 kg: 750 mg &gt;50 mg: 900 mg Rifapentine only recommended for patients receiving raltegravir or efavirenz-based ART regimen For persons exposed to drug-resistant TB, select anti-TB drugs after consultation with experts or public health authorities (AII).</td>
</tr>
</tbody>
</table>

| **Pneumocystis Pneumonia (PCP)** | CD4 count <200 cells/mm³ (AI), or CD4 <14% (BII), or If ART initiation must be delayed, CD4 count >200, but <250 cells/mm³ and if monitoring of CD4 cell count every 3 months is not possible (BII) Note: Patients who are receiving pyrimethamine/sulfadiazine for treatment or suppression of toxoplasmosis do not require additional PCP prophylaxis (AI). | TMP-SMX: 1 DS tablet PO daily (AI), or TMP-SMX: 1 SS tablet daily (AI) | TMP-SMX: 1 DS PO three times weekly (BII), or Dapsone: 100 mg PO daily or 50 mg PO BID (BII), or Dapsone: 50 mg PO daily with (pyrimethamine: 50 mg plus leucovorin 25 mg) PO weekly (BII), or (Dapsone: 200 mg plus pyrimethamine: 75 mg plus leucovorin 25 mg) PO weekly (BII); or Aerosolized pentamidine 300 mg via Respigard II™ nebulizer every month (BII), or Atovaquone 1500 mg PO daily (BII), or (Atovaquone 1500 mg plus pyrimethamine: 25 mg plus leucovorin 10 mg) PO daily (CIII) |

<td>Fluconazole 400 mg PO once weekly (BII)</td>
</tr>
<tr>
<td><em>Toxoplasma gondii</em> Encephalitis</td>
<td>• Toxoplasma IgG-positive patients with CD4 count &lt;100 cells/µL (AII) <strong>Note:</strong> All regimens recommended for primary prophylaxis against toxoplasmosis are also effective as PCP prophylaxis.</td>
<td>TMP-SMXc 1 DS PO daily (AII)</td>
<td>• TMP-SMXc 1 DS PO three times weekly (BIII), or • TMP-SMXc 1 SS PO daily (BIII), or • Dapsonea 50 mg PO daily + (pyrimethaminea 50 mg + leucovorin 25 mg) PO weekly (BII), or • (Dapsonea 200 mg + pyrimethaminea 75 mg + leucovorin 25 mg) PO weekly (BII); or • Atovaquone 1500 mg PO daily (CIII); or • (Atovaquone 1500 mg + pyrimethaminea 25 mg + leucovorin 10 mg) PO daily (CIII)</td>
</tr>
</tbody>
</table>
### Table 1. Prophylaxis to Prevent First Episode of Opportunistic Disease (page 6 of 6)

<table>
<thead>
<tr>
<th>Opportunistic Infections</th>
<th>Indication</th>
<th>Preferred</th>
<th>Alternative</th>
</tr>
</thead>
</table>
| Varicella-Zoster Virus (VZV) Infection | Pre-exposure prevention: Patients with CD4 counts ≥200 cells/µL who have not been vaccinated, have no history of varicella or herpes zoster, or who are seronegative for VZV (CIII)  
**Note:** Routine VZV serologic testing in HIV-infected adults and adolescents is not recommended.  
Post-exposure prevention:  
(AIII)  
Close contact with a person with chickenpox or herpes zoster; and is susceptible (i.e., no history of vaccination or of either condition, or known to be VZV seronegative) | Primary varicella vaccination (Varivax™), 2 doses (0.5 mL SQ each) administered 3 months apart (CIII).  
If vaccination results in disease because of vaccine virus, treatment with acyclovir is recommended (AIII).  
Post-exposure prevention:  
Varicella-zoster immune globulin (VariZIG™) 125 international units per 10 kg (maximum 625 international units) IM, administered as soon as possible and within 10 days after exposure (AIII).  
**Note:** VariZIG is exclusively distributed by FFF Enterprises at 800-843-7477.  
Individuals receiving monthly high-dose IVIG (>400 mg/kg) are likely to be protected if the last dose of IVIG was administered <3 weeks before exposure. | VZV-susceptible household contacts of susceptible HIV-infected persons should be vaccinated to prevent potential transmission of VZV to their HIV-infected contacts (BIII).  
**Alternative post-exposure prevention:**  
• Acyclovir 800 mg PO 5 x/day for 5–7 days (BIII), or  
• Valacyclovir 1 g PO TID for 5–7 days (BIII)  
These alternatives have not been studied in the HIV population.  
If antiviral therapy is used, varicella vaccines should not be given until at least 72 hours after the last dose of the antiviral drug. |

---

### Evidence Rating:

**Strength of Recommendation:**
- A: Strong recommendation for the statement
- B: Moderate recommendation for the statement
- C: Optional recommendation for the statement

**Quality of Evidence for the Recommendation:**
- I: One or more randomized trials with clinical outcomes and/or validated laboratory endpoints
- II: One or more well-designed, nonrandomized trials or observational cohort studies with long-term clinical outcomes
- III: Expert opinion

In cases where there are no data for the prevention or treatment of an OI based on studies conducted in HIV-infected populations, but data derived from HIV-uninfected patients exist that can plausibly guide management decisions for patients with HIV/AIDS, the data will be rated as III but will be assigned recommendations of A, B, C depending on the strength of recommendation.
**Table 2. Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy)** (Last updated June 14, 2019; last reviewed June 14, 2019)

<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bacterial Enteric Infections</strong></td>
<td>Diagnostic fecal specimens should be obtained before initiation of empiric antibiotic therapy. If culture is positive, antibiotic susceptibilities should be performed to inform antibiotic choices given increased reports of antibiotic resistance. If a culture independent diagnostic test is positive, reflex cultures for antibiotic susceptibilities should also be done. Empiric antibiotic therapy is indicated for advanced HIV patients (CD4 count &lt;200 cells/µL or concomitant AIDS-defining illnesses), with clinically severe diarrhea (≥6 stools/day or bloody stool) and/or accompanying fever or chills.</td>
<td>Empiric Therapy:  • Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (AIII) Therapy should be adjusted based on the results of diagnostic work-up. For patients with chronic diarrhea (&gt;14 days) without severe clinical signs, empiric antibiotics therapy is not necessary, can withhold treatment until a diagnosis is made.</td>
<td>Oral or IV rehydration (if indicated) should be given to patients with diarrhea (AIII). Antimotility agents should be avoided if there is concern about inflammatory diarrhea, including <em>Clostridium-difficile</em>-associated diarrhea (BIII). If no clinical response after 3-4 days, consider follow-up stool culture with antibiotic susceptibility testing or alternative diagnostic tests (e.g., toxin assays, molecular testing) to evaluate alternative diagnosis, antibiotic resistance, or drug-drug interactions. IV antibiotics and hospitalization should be considered in patients with marked nausea, vomiting, diarrhea, electrolyte abnormalities, acidosis, and blood pressure instability.</td>
</tr>
<tr>
<td><strong>Campylobacteriosis</strong></td>
<td>For Mild Disease and If CD4 Count &gt;200 cells/µL:  • No therapy unless symptoms persist for more than several days (CIII) For Mild-to-Moderate Disease Disease (If Susceptible):  • Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (BIII), or  • Azithromycin 500 mg PO daily (BIII) (Note: Not for patients with bacteremia (AIII)) For Campylobacter Bacteremia:  • Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (BIII) + an aminoglycoside (BII) Duration of Therapy:  • Gastroenteritis: 7–10 days (AIII) (5 days with azithromycin)  • Bacteremia: ≥14 days (BIII)  • Recurrent bacteremia: 2–6 weeks (BIII)</td>
<td>For Mild-to-Moderate Disease (If Susceptible):  • Levofloxacin 750 mg (PO or IV) q24h (BIII), or  • Moxifloxacin 400 mg (PO or IV) q24h (BIII) Add an aminoglycoside to fluoroquinolone in bacteremic patients (BIII).</td>
<td>Oral or IV rehydration if indicated (AIII). Antimotility agents should be avoided (BIII). If no clinical response after 5–7 days, consider follow-up stool culture, alternative diagnosis, or antibiotic resistance. There is an increasing rate of fluoroquinolone resistance in the United States (24% resistance in 2011). The rationale of addition of an aminoglycoside to a fluoroquinolone in bacteremic patients is to prevent emergence of quinolone resistance. Effective ART may reduce the frequency, severity, and recurrence of campylobacter infections.</td>
</tr>

<td><strong>Bacterial Enteric Infections, continued</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Shigellosis | • Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (AIII)  
**Duration of Therapy:**  
• *Gastroenteritis:* 7–10 days (AIII)  
(if azithromycin is used, treat for 5 days)  
• *Bacteremia:* ≥14 days (BIII)  
• *Recurrent Infections:* up to 6 weeks (BIII)  
**Note:** Increased resistance of *Shigella* to fluoroquinolones is occurring in the United States. Avoid fluoroquinolones if ciprofloxacin MIC is ≥0.12 ug/ml even if the laboratory identifies the isolate as sensitive. Many *Shigella* strains resistant to fluoroquinolones exhibit resistance to other commonly used antibiotics. Thus, antibiotic sensitivity testing of *Shigella* isolates from HIV-infected individuals should be performed routinely. | • Levofloxacin 750 mg (PO or IV) q24h (BIII), or  
• Moxifloxacin 400 mg (PO or IV) q24h (BIII), or  
• TMP 160 mg-SMX 800 mg (PO or IV) q12h (BIII) (Note: *Shigella* infections acquired outside of the United States have high rates of TMP-SMX resistance), or  
• Azithromycin 500 mg PO daily for 5 days (BIII) (Note: azithromycin is not recommended for patients with bacteremia [AIII])  
**Note:** Azithromycin-resistant *Shigella* spp has been reported in HIV-infected MSM. | Therapy is indicated both to shorten duration of illness and prevent spread of infection (AIII).  
Given increasing antimicrobial resistance and limited data showing that antibiotic therapy limits transmission, antibiotic treatment may be withheld in patients with CD4 >500 cells/mm³ whose diarrhea resolves prior to culture confirmation of *Shigella* infection (CIII).  
Oral or IV rehydration if indicated (AIII).  
Antimotility agents should be avoided (BIII).  
If no clinical response after 5–7 days, consider follow-up stool culture, alternative diagnosis, or antibiotic resistance.  
Effective ART may decrease the risk of recurrence of *Shigella* infections. |

<tr>
<td><strong>Bacterial Respiratory Diseases</strong> <em>(with focus on pneumonia)</em></td>
<td>Empiric antibiotic therapy should be initiated promptly for patients presenting with clinical and radiographic evidence consistent with bacterial pneumonia. The recommendations listed are suggested empiric therapy. The regimen should be modified as needed once microbiologic results are available (BIII).</td>
<td>Empiric Outpatient Therapy: A PO beta-lactam + PO macrolide (azithromycin or clarithromycin) (AII)</td>
<td>Fluoroquinolones should be used with caution in patients in whom TB is suspected but is not being treated. Empiric therapy with a macrolide alone is not routinely recommended, because of increasing pneumococcal resistance (BIII). Patients receiving a macrolide for MAC prophylaxis should not receive macrolide monotherapy for empiric treatment of bacterial pneumonia. For patients begun on IV antibiotic therapy, switching to PO should be considered when they are clinically improved and able to tolerate oral medications. Chemoprophylaxis can be considered for patients with frequent recurrences of serious bacterial pneumonia (CIII). Clinicians should be cautious about using antibiotics to prevent recurrences because of the potential for developing drug resistance and drug toxicities.</td>
</tr>
</tbody>
</table>

*Empiric Outpatient Therapy:*
- A PO beta-lactam + a PO macrolide (azithromycin or clarithromycin) (AII)
  - **Preferred beta-lactams:** high-dose amoxicillin or amoxicillin/clavulanate
  - **Alternative beta-lactams:** cefpodoxime or cefuroxime, or
  - **For penicillin-allergic patients:** Levofloxacin 750 mg PO once daily (AII), or moxifloxacin 400 mg PO once daily (AII)

*Duration: 7–10 days (a minimum of 5 days). Patients should be afebrile for 48–72 hours and clinically stable before stopping antibiotics.*

*Empiric Therapy for Non-ICU Hospitalized Patients:*
- An IV beta-lactam + a macrolide (azithromycin or clarithromycin) (AII)
  - **Preferred beta-lactams:** ceftriaxone, cefotaxime, or ampicillin-sulbactam
  - **For penicillin-allergic patients:** Levofloxacin, 750 mg IV once daily (AII), or moxifloxacin, 400 mg IV once daily (AII)

*Empiric Therapy for ICU Patients:*
- An IV beta-lactam + IV azithromycin (AII), or
- An IV beta-lactam + (levofloxacin 750 mg IV once daily or moxifloxacin 400 mg IV once daily) (AII)
  - **Preferred beta-lactams:** ceftriaxone, cefotaxime, or ampicillin-sulbactam

*Empiric Therapy for Patients at Risk of *Pseudomonas* Pneumonia:*
- An IV antipseudomonal beta-lactam + an aminoglycoside + azithromycin (BIII), or
  - Above beta-lactam + an aminoglycoside + (levofloxacin 750 mg IV once daily or moxifloxacin 400 mg IV once daily) (BIII), or
  - **For penicillin-allergic patients:** Replace the beta-lactam with aztreonam (BIII).

</tbody>
</table>
| Chagas Disease          | For Acute, Early Chronic, and Reactivated Disease:  
• Benznidazole 5–8 mg/kg/day PO in 2 divided doses for 30–60 days (BIII) (not commercially available in the United States; contact the CDC Drug Service at drugservice@cdc.gov or (404) 639-3670, or the CDC emergency operations center at (770) 488-7100)  
For Acute, Early Chronic, and Reactivated Disease:  
• Nifurtimox 8–10 mg/kg/day PO for 90–120 days (CIII) (not commercially available in the U.S., contact the CDC Drug Service at drugservice@cdc.gov or (404) 639-3670, or the CDC emergency operations center at (770) 488-7100)  
Treatment is effective in reducing parasitemia and preventing clinical symptoms or slowing disease progression. It is ineffective in achieving parasitological cure.  
Duration of therapy has not been studied in HIV-infected patients.  
Initiate or optimize ART in patients undergoing treatment for Chagas disease, once they are clinically stable (AIII). | | |
| Coccidioidomycosis | Clinically Mild Infections (e.g., Focal Pneumonia):  
• Fluconazole 400 mg* PO daily (AII), or  
• Itraconazole 200 mg* PO BID (BII)  
Bone or Joint Infections:  
• Itraconazole 200 mg* PO BID (AII)  
Severe, Non-Meningeal Infection (Diffuse Pulmonary Infection or Severely Ill Patients with Extrathoracic, Disseminated Disease):  
• Lipid formulation amphotericin B 3–5 mg/kg IV daily (AII), or  
• Amphotericin B deoxycholate 0.7–1.0 mg/kg IV daily (AII)  
• Duration of therapy: continue until clinical improvement, then switch to a triazole (BIII)  
Meningeal Infections:  
• Fluconazole 400–800 mg* IV or PO daily (AII)  
Mild Infections (Focal Pneumonia)  
For Patients Who Failed to Respond to Fluconazole or Itraconazole:  
• Posaconazole 300 mg delayed-release tablet* PO BID x 1 day, then once daily (BIII), or  
• Posaconazole 400 mg oral suspension* PO BID (BII), or  
• Voriconazole 200 mg* PO BID (BIII)  
Bone or Joint Infection:  
• Fluconazole 400 mg* PO daily (BII)  
Severe, Non-Meningeal Infection (Diffuse Pulmonary Infection or Severely Ill Patients with Extrathoracic, Disseminated Disease):  
• Some specialists will add a triazole (fluconazole* or itraconazole*) 400 mg per day to amphotericin B therapy and continue triazole once amphotericin B is stopped (BIII).  
Meningeal Infections:  
• Itraconazole 200 mg* PO TID for 3 days, then 200 mg PO BID (BII), or  
• Voriconazole 200–400 mg* PO BID (BIII), or  
• Posaconazole 300 mg delayed-release tablet* PO BID x 1 day, then once daily (CIII), or  
• Posaconazole 400 mg oral suspension* PO BID (CIII), or  
• Intrathecal amphotericin B deoxycholate, when triazole antifungals are ineffective (AIII)  
Relapse can occur in 25%–33% of HIV-negative patients with diffuse pulmonary or disseminated diseases. Therapy should be given for at least 12 months and usually much longer; discontinuation is dependent on clinical and serological response and should be made in consultation with experts (BIII).  
Therapy should be lifelong in patients with meningeal infections because relapse occurs in 80% of HIV-infected patients after discontinuation of triazole therapy (AII).  
*Fluconazole, itraconazole, posaconazole, and voriconazole may have significant interactions with other medications including ARV drugs. These interactions are complex and can be bi-directional. Refer to Table 5 or Antiretroviral guidelines for dosage recommendations. Therapeutic drug monitoring and dosage adjustment may be necessary to ensure triazole antifungal and antiretroviral efficacy and reduce concentration-related toxicities.  
Intrathecal amphotericin B should only be given in consultation with a specialist and administered by an individual with experience with the technique. | | |

</thead>
</table>
| Cryptococcosis                   | **Cryptococcal Meningitis**  
  *Induction Therapy (for at least 2 weeks, followed by consolidation therapy):*  
  - Liposomal amphotericin B 3–4 mg/kg IV daily + flucytosine 25 mg/kg PO QID (AI)  
  *Note: Flucytosine dose should be adjusted in patients with renal dysfunction.*  
  *Consolidation Therapy (for at least 8 weeks (AI), followed by maintenance therapy):*  
  - Fluconazole 400 mg PO (or IV) daily (AI)  
  **Maintenance Therapy:**  
  - Fluconazole 200 mg PO daily for at least 12 months (AI)  
  **For Non-CNS, Extrapulmonary Cryptococcosis and Diffuse Pulmonary Disease:**  
  - Treatment same as for cryptococcal meningitis (BII)  
  **Non-CNS Cryptococcosis with Mild-to-Moderate Symptoms and Focal Pulmonary Infiltrates:**  
  - Fluconazole, 400 mg PO daily for 12 months (BII)                                                                 | **Cryptococcal meningitis**  
  *Induction Therapy (for at least 2 weeks, followed by consolidation therapy):*  
  - Amphotericin B deoxycholate 0.7 mg/kg IV daily + fluconazole 25 mg/kg PO QID (AI), or  
  - Amphotericin B lipid complex 5 mg/kg IV daily + fluconazole 25 mg/kg PO QID (BII), or  
  - Liposomal amphotericin B 3–4 mg/kg IV daily + fluconazole 800 mg PO or IV daily (BII), or  
  - Fluconazole 1200 mg PO or IV daily (CII)  
  **Consolidation Therapy (for at least 8 weeks (AI), followed by maintenance therapy):**  
  - Itraconazole 200 mg PO BID for 8 weeks—less effective than fluconazole (CI)  
  **Maintenance Therapy:**  
  - No alternative therapy recommendation                                                                 | Addition of flucytosine to amphotericin B has been associated with more rapid sterilization of CSF and decreased risk for subsequent relapse.  
  - Patients receiving flucytosine should have either blood levels monitored (peak level 2 hours after dose should be 30–80 mcg/mL) or close monitoring of blood counts for development of cytopenia. Dosage should be adjusted in patients with renal insufficiency (BII).  
  - Opening pressure should always be measured when an LP is performed (AII). Repeated LPs or CSF shunting are essential to effectively manage increased intracranial pressure (BII).  
  - Corticosteroids and mannitol are ineffective in reducing ICP and are NOT recommended (BII).  
  - Corticosteroid should not be routinely used during induction therapy unless it is used for management of IRIS (AII). |
| Cryptosporidiosis                | **Initiate or optimize ART for immune restoration to CD4 count >100 cells/µL (AII), and**  
  - Aggressive oral or IV rehydration and replacement of electrolyte loss (AIII), and  
  - Symptomatic treatment of diarrhea with anti-motility agents (AIII).  
  **For Acute Infection:**  
  - TMP-SMX (160 mg/800 mg) PO (or IV) QID for 10 days (AII), or  
  - TMP-SMX (160 mg/800 mg) PO (or IV) BID for 7–10 days (BII)  
  - Can start with BID dosing first and increase daily dose and/or duration (up to 3–4 weeks) if symptoms worsen or persist (BII)  
  - IV therapy may be used for patients with potential or documented malabsorption.  
  **For Acute Infection:**  
  - Pyrimethamine 50–75 mg PO daily + leucovorin 10–25 mg PO daily (BII), or  
  - Ciprofloxacin 500 mg PO BID for 7 days (CI) as a second line alternative  
  **Chronic Maintenance Therapy (Secondary Prophylaxis):**  
  - TMP-SMX (160 mg/800 mg) PO daily or (320 mg/1600 mg) three times weekly (BIII)  
  *Corticosteroid should not be routinely used during induction therapy unless it is used for management of IRIS (AII).*  
  *Tincture of opium may be more effective than loperamide in management of diarrhea (CII).*                                                                 | No therapy has been shown to be effective without ART. Trial of these agents may be used in conjunction with, but not instead of, ART:  
  - Nitazoxanide 500–1000 mg PO BID for 14 days (CII), or  
  - Paromomycin 500 mg PO QID for 14–21 days (CII)  
  - With optimized ART, symptomatic treatment and rehydration and electrolyte replacement                                                                 | Fluid and electrolyte management in patients with dehydration (AIII).  
  - Nutritional supplementation for malnourished patients (AIII).  
  - Immune reconstitution with ART may result in fewer relapses (AIII). |
| Cystoisosporiasis (Formerly Isosporiasis) | For Acute Infection:  
  - TMP-SMX (160 mg/800 mg) PO (or IV) QID for 10 days (AII), or  
  - TMP-SMX (160 mg/800 mg) PO (or IV) BID for 7–10 days (BII)  
  - Can start with BID dosing first and increase daily dose and/or duration (up to 3–4 weeks) if symptoms worsen or persist (BII)  
  - IV therapy may be used for patients with potential or documented malabsorption.  
  **For Acute Infection:**  
  - Pyrimethamine 50–75 mg PO daily + leucovorin 10–25 mg PO daily (BII), or  
  - Ciprofloxacin 500 mg PO BID for 7 days (CI) as a second line alternative  
  **Chronic Maintenance Therapy (Secondary Prophylaxis):**  
  - TMP-SMX (160 mg/800 mg) PO daily or (320 mg/1600 mg) three times weekly (BIII)  
  *Corticosteroid should not be routinely used during induction therapy unless it is used for management of IRIS (AII).*  
  *Tincture of opium may be more effective than loperamide in management of diarrhea (CII).* |
### Table 2: Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy) (page 9 of 23)

</thead>
<tbody>
<tr>
<td>Cystoisosporiasis (Formerly Isosporiasis), continued</td>
<td>Chronic Maintenance Therapy (Secondary Prophylaxis): • In patients with CD4 count &lt;200/µL, TMP-SMX (160 mg/800 mg) PO TIW (AII)</td>
<td>Pyrimethamine 25 mg PO daily + leucovorin 5–10 mg PO daily (BII)</td>
<td>The choice of therapy for CMV retinitis should be individualized, based on location and severity of the lesions, level of immunosuppression, and other factors (e.g., concomitant medications and ability to adhere to treatment) (AIII). Given the evident benefits of systemic therapy in preventing contralateral eye involvement, reduce CMV visceral disease and improve survival. Whenever feasible, treatment should include systemic therapy. The ganciclovir ocular implant, which is effective for treatment of CMV retinitis is no longer available. For sight threatening retinitis, intravitreal injections of ganciclovir or foscarnet can be given to achieve higher ocular concentration faster.</td>
</tr>
<tr>
<td>Cytomegalovirus (CMV) Disease</td>
<td>CMV Retinitis Induction Therapy (followed by Chronic Maintenance Therapy): For Immediate Sight-Threatening Lesions (within 1500 microns of the fovea): • Intravitreal injections of ganciclovir (2 mg) or foscarnet (2.4 mg) for 1–4 doses over a period of 7–10 days to achieve high intraocular concentration faster (AIII); plus • Valganciclovir 900 mg PO BID for 14–21 days, then 900mg once daily (AI):</td>
<td>CMV Retinitis For Immediate Sight-Threatening Lesions (within 1500 microns of the fovea): Intravitreal therapy as listed in the Preferred section, plus one of the following: Alternative Systemic Induction Therapy (followed by Chronic Maintenance Therapy): • Ganciclovir 5 mg/kg IV 12h for 14–21 days (AI), or • Foscarnet 90 mg/kg IV q12h or 60 mg/kg q8h for 14–21 days (AI), or • Cidofovir 5 mg/kg/week IV for 2 weeks; saline hydration before and after therapy and probenecid, 2 g PO 3 hours before dose, followed by 1 g PO 2 hours and 8 hours after the dose (total of 4 g) (BI). (Note: This regimen should be avoided in patients with sulfa allergy because of cross hypersensitivity with probenecid.) Chronic Maintenance (for 3-6 months until ART induced immune recovery (see Table 4): • Ganciclovir 5 mg/kg IV 5–7 times weekly (AI), or • Foscarnet 90–120 mg/kg IV once daily (AI), or • Cidofovir 5 mg/kg IV every other week with saline hydration and probenecid as above (BI)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For Peripheral Lesions: • Valganciclovir 900 mg PO BID for 14–21 days, then 900 mg once daily (AI). Chronic Maintenance: • Valganciclovir 900 mg PO daily (AI) for 3-6 months until ART induced immune recovery (see Table 4). CMV Esophagitis or Colitis: • Ganciclovir 5 mg/kg IV q12h; may switch to valganciclovir 900 mg PO q12h once the patient can tolerate oral therapy (BII). • Duration: 21–42 days or until symptoms have resolved (CII). Maintenance therapy is usually not necessary, but should be considered after relapses (BII). Well-Documented, Histologically Confirmed CMV Pneumonia: • Experience for treating CMV pneumonitis in HIV patients is limited. Use of IV ganciclovir or IV foscarnet is reasonable (doses same as for CMV retinitis) (CIII). • The optimal duration of therapy and the role of oral valganciclovir have not been established. CMV Neurological Disease Note: Treatment should be initiated promptly.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Chronic Maintenance (for 3-6 months until ART induced immune recovery (see Table 4): • Ganciclovir 5 mg/kg IV 5–7 times weekly (AI), or • Foscarnet 90–120 mg/kg IV once daily (AI), or • Cidofovir 5 mg/kg IV every other week with saline hydration and probenecid as above (BI)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>CMV Esophagitis or Colitis: • Foscarnet 90 mg/kg IV q12h or 60 mg/kg q8h (BI) for patients with treatment-limiting toxicities to ganciclovir or with ganciclovir resistance, or • Valganciclovir 900 mg PO q12h in milder disease and if able to tolerate PO therapy (BII), or • Duration: 21–42 days or until symptoms have resolved (CII)</td>
<td></td>
<td></td>

<tbody>
<tr>
<td>Cytomegalovirus (CMV) Disease, continued</td>
<td>Ganciclovir 5 mg/kg IV q12h + (foscarnet 90 mg/kg IV q12h or 60 mg/kg IV q8h) to stabilize disease and maximize response, continue until symptomatic improvement and resolution of neurologic symptoms (CIII) • The optimal duration of therapy and the role of oral valganciclovir have not been established. • Optimize ART to achieve viral suppression and immune reconstitution (BIII).</td>
<td>For mild disease, if ART can be initiated without delay, consider withholding CMV therapy (CIII).</td>
<td></td>
</tr>
<tr>
<td>Hepatitis B Virus (HBV) Disease</td>
<td>ART is recommended for all HIV/HBV-co-infected patients regardless of CD4 cell count (AII). ART regimen should include 2 drugs that are active against both HBV and HIV, with ([tenofovir DF 300 mg or tenofovir alafenamide* 10 or 25mg] + (emtricitabine 200 mg or lamivudine 300 mg)) PO once daily (+ additional drug (s) for HIV) (AIII). Please refer to Table 7 for dosing recommendations in patients with renal impairment. Duration: Continue treatment indefinitely (CIII) * Tenofovir alafenamide (TAF) 10 mg dose is in the fixed dose combination tablets of elvitegravir/cobicistat/TAF/emtricitabine and darunavir/cobicistat/TAF/emtricitabine; when TAF is used with other ARVs, the dose is 25 mg. For Patients Who Refuse or Are Unable to Take ART or Who Are HIV Long-Term Non-Progressors: HBV treatment is indicated for all those who meet criteria for treatment according to the AASLD 2018 guidelines. • Peginterferon alfa-2a 180 µg SQ once weekly for 48 weeks (CIII), or • Peginterferon alfa 2b 1.5 µg/kg SQ once weekly for 48 weeks (CIII)</td>
<td>Directly acting HBV drugs such as adefovir, emtricitabine, entecavir, lamivudine, telbivudine, or tenofovir must not be given in the absence of a fully suppressive ART regimen to avoid selection of drug resistance HIV (AII). Cross-resistance to emtricitabine or telbivudine should be assumed in patients with suspected or proven lamivudine-resistance. When changing ART regimens, continue agents with anti-HBV activity (BIII). If anti-HBV therapy is discontinued and a flare occurs, therapy should be re-instituted because it can be potentially life-saving (AIII). As HBV reactivation can occur during treatment for HCV with directly active agents (DAAs) in the absence of HBV-active drugs, all patients with HIV/HBV coinfection who will be treated for HCV should be on HBV-active ART at the time of HCV treatment initiation (AIII).</td>
<td></td>
</tr>
<tr>
<td>Hepatitis C Virus (HCV) Disease</td>
<td>The field of HCV drug development is evolving rapidly. The armamentarium of approved drugs is likely to expand considerably in the next few years. Clinicians should refer to the most recent HCV treatment guidelines (<a href="http://www.hcvguidelines.org">http://www.hcvguidelines.org</a>) for the most updated recommendations.</td>

</table>
| Human Herpesvirus-8 Diseases (Kaposi Sarcoma [KS], Primary Effusion Lymphoma [PEL], Multicentric Castleman’s Disease [MCD]) | Mild To Moderate KS (localized involvement of skin and/or lymph nodes):  
  • Initiate or optimize ART (AII)  
Advanced KS [visceral (AI) or disseminated cutaneous KS (BII)]:  
  • Chemotherapy (per oncology consult) + ART  
  • Liposomal doxorubin first line chemotherapy (AI)  
Primary Effusion Lymphoma:  
  • Chemotherapy (per oncology consult) + ART (AIII)  
  • PO valganciclovir or IV ganciclovir can be used as adjunctive therapy (CIII).  
MCD Therapy Options (in consultation with specialist, depending on HIV/HHV-8 status, presence of organ failure, and refractory nature of disease):  
  • ART (AIII) along with one of the following  
  • Valganciclovir 900 mg PO BID for 3 weeks (CII), or  
  • Ganciclovir 5 mg/kg IV q12h for 3 weeks (CII), or  
  • Valganciclovir PO or Ganciclovir IV + zidovudine 600 mg PO q6h for 7–21 days (CII)  
  • Rituximab +/- Prednisone (CII)  
  • Monoclonal antibody targeting IL-6 or IL-6 receptor (BII)  
Concurrent KS and MCD  
  • Rituximab + liposomal doxorubicin (BII) | MCD  
  • Rituximab (375 mg/m² given weekly for 4–8 weeks) may be an alternative to or used adjunctively with antiviral therapy (CII). |  
  • Corticosteroids should be avoided in patients with KS, including those with KS-IRis (AIII)  
  • Corticosteroids are potentially effective as adjunctive therapy for MCD, but should be used with caution, esp. in patients with concurrent KS.  
  • Patients who received rituximab for MCD may experience subsequent exacerbation or emergence of KS. |

<td>Human Papillomavirus (HPV) Disease</td>
<td>Treatment of Condyloma Acuminata (Genital Warts)</td>
<td>Provider-Applied Therapy for Complex or Multicentric Lesions, or Lesions Inaccessible to Patient Applied Therapy:</td>
<td>HIV-infected patients may have larger or more numerous warts and may not respond as well to therapy for genital warts when compared to HIV-uninfected individuals.</td>
</tr>
<tr>
<td></td>
<td>Patient-Applied Therapy for Uncomplicated External Warts That Can Be Easily Identified by Patients:</td>
<td>• Cryotherapy (liquid nitrogen or cryoprobe): Apply until each lesion is thoroughly frozen. Repeat every 1–2 weeks for up to 4 weeks, until lesions are no longer visible (BIII), or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Podophyllotoxin (e.g., podofilox 0.5% solution or 0.5% gel): Apply to all lesions BID for 3 consecutive days, followed by 4 days of no therapy, repeat weekly for up to 4 cycles, until lesions are no longer visible (BIII), or</td>
<td>• Trichloroacetic acid or bichloroacetic acid cauterization: 80%–90% aqueous solution, apply to wart only, allow to dry until a white frost develops. Repeat weekly for up to 6 weeks, until lesions are no longer visible (BIII), or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Imiquimod 5% cream: Apply to lesion at bedtime and remove in the morning on 3 non-consecutive nights weekly for up to 16 weeks, until lesions are no longer visible. Each treatment should be washed with soap and water 6–10 hours after application (BIII), or</td>
<td>• Surgical excision (BIII) or laser surgery (CIII) to external or anal warts, or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Sinecatechins 15% ointment: Apply to affected areas TID for up to 16 weeks, until warts are completely cleared and not visible (BIII).</td>
<td>• Podophyllin resin 10%–25% in tincture of benzoin: Apply to all lesions (up to 10 cm²), then wash off a few hours later, repeat weekly for up to 6 weeks until lesions are no longer visible (CIII).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Topical cidofovir has activity against genital warts, but the product is not commercially available (CIII).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Intrallesional interferon-alpha is usually not recommended because of high cost, difficult administration, and potential for systemic side effects (CIII).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The rate of recurrence of genital warts is high despite treatment in HIV-infected patients.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>There is no consensus on the treatment of oral warts. Many treatments for anogenital warts cannot be used in the oral mucosa. Surgery is the most common treatment for oral warts that interfere with function or for aesthetic reasons.</td>
<td></td>

</tbody>
</table>
| Leishmaniasis | For Initial Infection:  
• Liposomal amphotericin B 2–4 mg/kg IV daily (AII), or  
• Liposomal amphotericin B interrupted schedule (e.g., 4 mg/kg on days 1–5, 10, 17, 24, 31, 38) (AII)  
• To achieve total dose of 20–60 mg/kg (AII)  
Chronic Maintenance Therapy (Secondary Prophylaxis): Especially in Patients with CD4 Count <200 cells/µL:  
• Liposomal amphotericin B 4 mg/kg every 2–4 weeks (AII), or  
• Amphotericin B lipid complex (AII) 3 mg/kg every 21 days (AII) | For Initial Infection:  
• Other lipid formulation of amphotericin B, dose and schedule as in Preferred Therapy, or  
• Amphotericin B deoxycholate 0.5–1.0 mg/kg IV daily for total dose of 1.5–2.0 g (BII), or  
• Sodium stibogluconate (pentavalent antimony) (BII) 20 mg/kg IV or IM daily for 28 days.  
Another Option:  
• Miltefosine 100 mg PO daily for 4 weeks (available in the United States under a treatment IND) (CIII)  
Chronic Maintenance Therapy (Secondary Prophylaxis):  
• Sodium stibogluconate 20 mg/kg IV or IM every 4 weeks (BII) | ART should be initiated or optimized (AIII).  
For sodium stibogluconate, contact the CDC Drug Service at (404) 639-3670 or drugservice@cdc.gov. |
| Cutaneous | • Liposomal amphotericin B 2–4 mg/kg IV daily for 10 days (BIII), or  
• Liposomal amphotericin B interrupted schedule (e.g., 4 mg/kg on days 1–5, 10, 17, 24, 31, 38) to achieve total dose of 20–60 mg/kg (BIII), or  
• Sodium stibogluconate 20 mg/kg IV or IM daily for 3–4 weeks (BIII)  
Chronic Maintenance Therapy:  
May be indicated in immunocompromised patients with multiple relapses (CIII) | Possible Options Include:  
• Oral miltefosine (can be obtained via a treatment IND), or  
• Topical paromomycin, or  
• Intrallesional sodium stibogluconate, or  
• Local heat therapy  
No data exist for any of these agents in HIV-infected patients; choice and efficacy dependent on species of Leishmania. | None. |
| Malaria | Because *Plasmodium falciparum* malaria can progress within hours from mild symptoms or low-grade fever to severe disease or death, all HIV-infected patients with confirmed or suspected *P. falciparum* infection should be hospitalized for evaluation, initiation of treatment, and observation (AII).  
Treatment recommendations for HIV-infected patients are the same as HIV-uninfected patients (AIII). | When suspicion for malaria is low, antimalarial treatment should not be initiated until the diagnosis is confirmed.  
For treatment recommendations for specific regions, clinicians should refer to the following web link:  
http://www.cdc.gov/malaria/  
or call the CDC Malaria Hotline: (770) 488-7788; M–F 8 AM–4:30 PM ET, or (770) 488-7100 after hours | For treatment recommendations for specific regions, clinicians should refer to the following web link:

<tr>
<td><strong>Mycobacterium avium</strong>&lt;br&gt;Complex (MAC) Disease</td>
<td>At Least 2 Drugs as Initial Therapy to Prevent or Delay Emergence of Resistance:&lt;br&gt;• Clarithromycin 500 mg PO BID (AI) + ethambutol 15 mg/kg PO daily (AI), or&lt;br&gt;• If drug interaction or intolerance precludes the use of clarithromycin, (azithromycin 500–600 mg + ethambutol 15 mg/kg) PO daily (AII)</td>
<td>Some experts recommend addition of a third or fourth drug for patients with high mycobacterial loads (&gt;2 log CFU/mL of blood), or in the absence of effective ART (CIII).&lt;br&gt;<strong>Third or Fourth Drug Options May Include:</strong>&lt;br&gt;• Rifabutin 300 mg PO daily (dose adjustment may be necessary based on drug interactions) (CI), or&lt;br&gt;• A fluoroquinolone such as moxifloxacin 400 mg PO daily (CIII) or levofloxacin 500 mg PO daily (CIII), or&lt;br&gt;• An injectable aminoglycoside such as amikacin 10–15 mg/kg IV daily (CIII) or streptomycin 1 g IV or IM daily (CIII)</td>
<td>Testing of susceptibility to clarithromycin and azithromycin is recommended (BIII).&lt;br&gt;NSAIDs can be used for moderate to severe symptoms attributed to IRIS (CIII). If IRIS symptoms persist, short course (i.e., 4 weeks–8 weeks) systemic corticosteroid (equivalent to 20–40 mg prednisone) can be used (CII).</td>
</tr>
<tr>
<td><strong>Mycobacterium tuberculosis</strong>&lt;br&gt;(TB) Disease</td>
<td>After collecting specimen for culture and molecular diagnostic tests, empiric TB treatment should be started in individuals with clinical and radiographic presentation suggestive of TB (AIII).&lt;br&gt;Refer to Table 3 for dosing recommendations.&lt;br&gt;<strong>Initial Phase (2 Months, Given Daily, 5–7 Times/Week by DOT) (AI):</strong>&lt;br&gt;• INH + [RIF or RFB] + PZA + EMB (AI), Continuation Phase:&lt;br&gt;• INH + (RIF or RFB) daily (5–7 times/week) (AIII)</td>
<td><strong>Treatment for Drug-Resistant TB</strong>&lt;br&gt;<strong>Resistant to INH:</strong>&lt;br&gt;• (RIF or RFB) + EMB + PZA + (moxifloxacin or levofloxacin) for 2 months (BII); followed by (RIF or RFB) + EMB + (moxifloxacin or levofloxacin) for 7 months (BII)&lt;br&gt;<strong>Resistant to Rifamycins +/- Other Drugs:</strong>&lt;br&gt;• Regimen and duration of treatment should be individualized based on resistance pattern, clinical and microbiological responses, and in close consultation with experienced specialists (AIII).</td>
<td>Adjunctive corticosteroid improves survival for TB meningitis and pericarditis (AI). See text for drug, dose, and duration recommendations. All rifamycins may have significant pharmacokinetic interactions with antiretroviral drugs, please refer to the Drug Interactions section in the Adult and Adolescent ARV Guidelines for dosing recommendations. Therapeutic drug monitoring should be considered in patients receiving rifamycin and interacting ART. Paradoxical IRIS that is not severe can be treated with NSAIDs without a change in TB or HIV therapy (BIII). For severe IRIS reaction, consider prednisone and taper over 4 weeks based on clinical symptoms (BIII). For example:&lt;br&gt;• If receiving RIF: prednisone 1.5 mg/kg/day for 2 weeks, then 0.75 mg/kg/day for 2 weeks&lt;br&gt;• If receiving RFB: prednisone 1.0 mg/kg/day for 2 weeks, then 0.5 mg/kg/day for 2 weeks</td>

<tbody>
<tr>
<td><strong>Mycobacterium tuberculosis (TB) Disease, continued</strong></td>
<td>Patients who develop PCP despite TMP-SMX prophylaxis can usually be treated with standard doses of TMP-SMX (BIII). Duration of PCP treatment: 21 days (AII) For Moderate to Severe PCP: • TMP-SMX: (TMP 15–20 mg and SMX 75–100 mg)/kg/day, given PO in 3 divided doses (AII), or  • TMP-SMX: (160 mg/800 mg or DS) two tablets PO three times daily (AI) Secondary Prophylaxis, After Completion of PCP Treatment: • TMP-SMX DS: 1 tablet PO daily (AI), or  • TMP-SMX (80 mg/400 mg or SS): 1 tablet PO daily (AI)</td>
<td>For Moderate-to-Severe PCP: • Pentamidine 4 mg/kg IV daily infused over ≥60 minutes (AI); can reduce dose to 3 mg/kg IV daily in the event of toxicities (BII), or • Primaquine 30 mg (base) PO daily plus (clindamycin 600 mg IV every 6 hours or 900 mg IV every 8 hours) or (clindamycin 450 mg PO every 6 hours or 600 mg PO every 8 hours) (AI) For Mild-to-Moderate PCP: • Dapsone 100 mg PO daily plus TMP 5 mg/kg PO TID (BII), or  • Primaquine 30 mg (base) PO daily plus (clindamycin 450 mg PO every 6 hours or 600 mg PO every 8 hours) (BII), or  • Atovaquone 750 mg PO twice daily with food (BII)</td>
<td>A more gradual tapering schedule over a few months may be necessary for some patients.</td>
</tr>
<tr>
<td><strong>Pneumocystis Pneumonia (PCP)</strong></td>
<td>Indications for Adjunctive Corticosteroids (AI): • PaO₂ &lt;70 mmHg at room air, or  • Alveolar-arterial DO₂ gradient &gt;35 mmHg Prednisone Doses (Beginning as Early as Possible and Within 72 Hours of PCP Therapy) (AI): • Days 1–5: 40 mg PO twice daily  • Days 6–10: 40 mg PO daily  • Days 11–21: 20 mg PO daily IV methylprednisolone can be administered as 75% of prednisone dose. Benefit of corticosteroid if started after 72 hours of treatment is unknown, but some clinicians will use it for moderate-to-severe PCP (BIII). Whenever possible, patients should be tested for G6PD before use of dapsone or primaquine. Alternative therapy should be used in patients found to have G6PD deficiency. Patients who are receiving pyrimethamine/sulfadiazine for treatment or suppression of toxoplasmosis do not require additional PCP prophylaxis (AII). If TMP-SMX is discontinued because of a mild adverse reaction, re-institution should be considered after the reaction resolves (AII). The dose can be increased gradually (desensitization) (BII), reduced, or the frequency modified (CIII). TMP-SMX should be permanently discontinued in patients with possible or definite Stevens-Johnson Syndrome or toxic epidermal necrosis (AII).</td>
<td>Secondary Prophylaxis, After Completion of PCP Treatment: • TMP-SMX DS: 1 tablet PO three times weekly (BII), or  • Dapsone 100 mg PO daily (BII), or  • Dapsone 50 mg PO daily with (pyrimethamine 50 mg plus leucovorin 25 mg) PO weekly (BII), or  • (Dapsone 200 mg plus pyrimethamine 75 mg plus leucovorin 25 mg) PO weekly (BII), or  • Aerosolized pentamidine 300 mg monthly via Respigrad nebulizer (BII), or • Atovaquone 1500 mg PO daily (BII), or  • (Atovaquone 1500 mg plus pyrimethamine 25 mg plus leucovorin 10 mg) PO daily (CIII)</td>

<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| Talaromycosis (Formerly Penicilliosis) | For Acute Infection in Severely Ill Patients:  
• Liposomal amphotericin B 3–5 mg/kg/day IV for 2 weeks, followed by itraconazole 200 mg PO BID for 10 weeks (AII), followed by chronic maintenance therapy (as below)  
For Mild Disease:  
• Itraconazole 200 mg PO BID for 8 weeks (BII); followed by chronic maintenance therapy (as below)  
Chronic Maintenance Therapy (Secondary Prophylaxis):  
• Itraconazole 200 mg PO daily (AI) | For Acute Infection in Severely Ill Patients:  
• Voriconazole 6 mg/kg IV q12h for 1 day, then 4 mg/kg IV q12h for at least 3 days, followed by 200 mg PO BID for a maximum of 12 weeks (BII), followed by maintenance therapy  
For Mild Disease:  
• Voriconazole 400 mg PO BID for 1 day, then 200 mg BID for a maximum of 12 weeks (BII), followed by chronic maintenance therapy | ART should be initiated simultaneously with treatment for penicilliosis to improve treatment outcome (CIII).  
Itraconazole and voriconazole may have significant interactions with certain ARV agents. These interactions are complex and can be bi-directional. Refer to Table 5 for dosage recommendations.  
Therapeutic drug monitoring and dosage adjustment may be necessary to ensure triazole antifungal and ARV efficacy and reduce concentration-related toxicities. |

- Atovaquone 1500 mg PO BID with food + pyrimethamine\(^a\) (leucovorin)* (BII), or  
- Atovaquone 1500 mg PO BID with food + sulfadiazine 1000–1500 mg PO q6h (weight-based dosing, as in preferred therapy) (BII), or  
- Atovaquone 1500 mg PO BID with food (BII) | **If** pyrimethamine is unavailable or there is a delay in obtaining it, **TMP-SMX** should be utilized in place of **pyrimethamine-sulfadiazine (BI).**  
For patients with a history of sulfa allergy, sulfa desensitization should be attempted using one of several published strategies (BI).  
Atovaquone should be administered until therapeutic doses of **TMP-SMX** are achieved (CIII).  
Adjunctive corticosteroids (e.g., dexamethasone) should only be administered when clinically indicated to treat mass effect associated with focal lesions or associated edema (BIII); discontinue as soon as clinically feasible.  
Anticonvulsants should be administered to patients with a history of seizures (AIII) and continued through acute treatment, but should not be used as seizure prophylaxis (AIII).  
If clindamycin is used in place of sulfadiazine, additional therapy must be added to prevent PCP (AII). |
| **Duration for Acute Therapy:**  
- At least 6 weeks (BII); longer duration if clinical or radiologic disease is extensive or response is incomplete at 6 weeks  
- After completion of acute therapy, all patients should be initiated on chronic maintenance therapy  
**Chronic Maintenance Therapy:**  
- Pyrimethamine\(^a\) 25–50 mg PO daily + sulfadiazine 2000–4000 mg PO daily (in 2–4 divided doses) + leucovorin 10–25 mg PO daily (AI) | **Chronic Maintenance Therapy:**  
- Clindamycin 600 mg PO q8h + (pyrimethamine\(^a\) 25–50 mg + leucovorin 10–25 mg) PO daily (BI), or  
- TMP-SMX DS 1 tablet BID (BII), or  
- TMP-SMX DS 1 tablet once daily (BII); or  
- Atovaquone 750–1500 mg PO BID + (pyrimethamine\(^a\) 25 mg + leucovorin 10 mg) PO daily (BII), or  
- Atovaquone 750–1500 mg PO BID + sulfadiazine 2000–4000 mg PO daily (in 2–4 divided doses) (BII), or  
- Atovaquone 750–1500 mg PO BID with food (BII) |  |
| * Pyrimethamine\(^a\) and leucovorin doses are the same as for preferred therapy. |  |  |

Evidence Rating:

Strength of Recommendation:
A: Strong recommendation for the statement
B: Moderate recommendation for the statement
C: Optional recommendation for the statement

Quality of Evidence for the Recommendation:
I: One or more randomized trials with clinical outcomes and/or validated laboratory endpoints
II: One or more well-designed, nonrandomized trials or observational cohort studies with long-term clinical outcomes
III: Expert opinion

In cases where there are no data for the prevention or treatment of an OI based on studies conducted in HIV-infected populations, but data derived from HIV-uninfected patients exist that can plausibly guide management decisions for patients with HIV/AIDS, the data will be rated as III but will be assigned recommendations of A, B, C depending on the strength of recommendation.

Table 5. Significant Pharmacokinetic Interactions for Drugs Used to Treat or Prevent Opportunistic Infections (page 1 of 15)  (Last updated September 22, 2017; last reviewed September 22, 2017)

This table lists the known or suspected/predicted pharmacokinetic interactions between drugs used for the treatment or prevention of HIV-associated opportunistic infections (OIs). Many of the drugs listed in this table may also interact with antiretroviral drugs. Clinicians should refer to the drug interaction tables in the most current Guidelines for the Use of Antiretroviral Agents in HIV-1-Infected Adults and Adolescents to assess interaction potentials between OI drugs and antiretroviral therapy (ART).

Throughout the table, three recommendations are commonly used when concomitant administration of two drugs may lead to untoward consequences. The rationale for these recommendations are summarized below:

“Do not co-administer”

Indicates there is either strong evidence or strong likelihood that the drug-drug interaction cannot be managed with a dose modification of one or both drugs, and will/may result in either:

1) Increase in concentrations of one or both drugs, which may lead to excessive risk of toxicity; or
2) Decrease in concentrations of one or both drugs, which may render one or both drugs ineffective.

“Co-administration should be avoided, if possible”

There is a potential for significant pharmacokinetic interactions. However, co-administration of the drugs may be necessary if there are no other acceptable therapeutic options that provide a more favorable benefit-to-risk ratio. If other more favorable options exist, clinicians are advised to consider changing components of the regimen to accommodate a safer or more effective regimen.

“Use with caution”

Drug combinations are recommended to be used with caution when:

1. Pharmacokinetic studies have shown a moderate degree of interaction of unknown clinical significance; or
2. Based on the known metabolic pathway of the two drugs, there is a potential for pharmacokinetic interaction of unknown clinical significance.

Rifamycin-Related Interactions

Rifamycins are potent inducers of Phase I and Phase II drug metabolizing reactions. Daily doses of rifampin are well studied, and induction increases over a week or more. Based on limited data, larger doses of rifampin (e.g., 1200 mg) appear to produce the same maximum induction, but more rapidly. Single doses of rifampin may not produce significant induction. In general, rifabutin is about 40% as potent a CYP3A4 inducer as rifampin, but this can vary by substrate and enzymatic reaction. In general, daily rifapentine (for active tuberculosis [TB] disease) is at least as potent an inducer as rifampin. However, the potential of drug interactions with once weekly rifapentine (prescribed with isoniazid for latent TB infection) is not well studied, but may result in reduction of exposure of drugs that are CYP3A4 substrates. When a rifamycin is used with a potential interacting drug, close monitoring for clinical efficacy of the other agent is advised.

**Key to Acronyms:** 14-OH = active metabolite of clarithromycin; AUC = area under the curve; C24h = concentration at 24h post dose; Cmin = minimum concentration; C24 = concentration at steady state; CYP3A4 = Cytochrome P450 3A4; des-Rbt = desacetyl rifabutin; DHA = dihydroartemisinin; EFV = efavirenz; EVG = elvitegravir; FTC = emtricitabine; HCV = hepatitis C virus; PI/c = cobicistat-boosted protease inhibitor; PI/r = ritonavir-boosted protease inhibitor; RPV = rilpivirine; T1/2 = half-life; TAF = tenofovir alafenamide; TB = tuberculosis; TDF = tenofovir disoproxil fumarate

* Rifamycins are potent inducers of Phase I and Phase II drug-metabolizing reactions. Daily doses of rifampin are well studied, and induction increases over a week or more. Based on limited data, larger doses of rifampin (for example, 1200 mg) appear to produce the same maximum induction, but more rapidly. Single doses of rifampin may not produce significant induction. In general, rifabutin is about 40% as potent a CYP3A4 inducer as rifampin, but this can vary by substrate and enzymatic reaction. In general, daily rifapentine (for active TB disease) is at least as potent an inducer as rifampin. However, the potential of drug interactions with once weekly rifapentine (for latent TB infection, along with isoniazid) is not well studied, but may result in reduction of exposure of drugs that are CYP3A4 substrates. When a rifamycin is used with a potential interacting drug, close monitoring for clinical efficacy of the other agent is advised.

<tbody>
<tr>
<td>Acyclovir</td>
<td>B</td>
<td>No teratogenicity in mice, rats, rabbits at human levels. Large experience in pregnancy (&gt;700 first-trimester exposures reported to registry); well-tolerated.</td>
<td>Treatment of frequent or severe symptomatic herpes outbreaks or varicella.</td>
</tr>
<tr>
<td>Adefovir</td>
<td>C</td>
<td>No increase in malformations at 23 times (rats) and 40 times (rabbits) human dose. Limited experience with human use in pregnancy.</td>
<td>Not recommended because of limited data in pregnancy. Report exposures during pregnancy to Antiretroviral Pregnancy Registry: <a href="http://www.APRegistry.com">http://www.APRegistry.com</a></td>
</tr>
<tr>
<td>Albendazole</td>
<td>C</td>
<td>Embryotoxic and teratogenic (skeletal malformations) in rats and rabbits, but not in mice or cows. Limited experience in human pregnancy.</td>
<td>Not recommended, especially in first trimester. Primary therapy for microsporidiosis in pregnancy should be ART.</td>
</tr>
<tr>
<td>Amikacin</td>
<td>C</td>
<td>Not teratogenic in mice, rats, rabbits. Theoretical risk of ototoxicity in fetus; reported with streptomycin but not amikacin.</td>
<td>Drug-resistant TB, severe MAC infections</td>
</tr>
<tr>
<td>Amoxicillin, amox./clavulanate, ampicillin/sulbactam</td>
<td>B</td>
<td>Not teratogenic in animals. Large experience in human pregnancy does not suggest an increase in adverse events.</td>
<td>Susceptible bacterial infections</td>
</tr>
<tr>
<td>Amphotericin B</td>
<td>B</td>
<td>Not teratogenic in animals or in human experience. Preferred over azole antifungals in first trimester if similar efficacy expected.</td>
<td>Documented invasive fungal disease</td>
</tr>
<tr>
<td>Antimonials, pentavalent (stibogluconate, meglumine)</td>
<td>Not FDA approved</td>
<td>Antimony not teratogenic in rats, chicks, sheep. Three cases reported of use in human pregnancy in second trimester with good outcome. Labeled as contraindicated in pregnancy.</td>
<td>Therapy of visceral leishmaniasis not responsive to amphotericin B or pentamidine</td>
</tr>
<tr>
<td>Artesunate, artemether, artemether/lumefantrine</td>
<td>C</td>
<td>Embryotoxicity, cardiovascular and skeletal anomalies in rats and rabbits. Embryotoxic in monkeys. Human experience, primarily in the second and third trimesters, has not identified increased adverse events.</td>
<td>Recommended by WHO as first-line therapy in second/third trimester for <em>P. falciparum</em> and severe malaria. Pending more data, use for malaria in first trimester only if other drugs not available or have failed. Report cases of exposure to WHO Anti-malarial Pregnancy Exposure Registry when available.</td>
</tr>
<tr>
<td>Atovaquone</td>
<td>C</td>
<td>Not teratogenic in rats or rabbits, limited human experience</td>
<td>Alternate agent for PCP, <em>Toxoplasma gondii</em>, malaria infections</td>
</tr>
<tr>
<td>Azithromycin</td>
<td>B</td>
<td>Not teratogenic in animals. Moderate experience with use in human pregnancy does not suggest adverse events.</td>
<td>Preferred agent for MAC prophylaxis or treatment (with ethambutol), <em>Chlamydia trachomatis</em> infection in pregnancy.</td>
</tr>
<tr>
<td>Aztreonam</td>
<td>B</td>
<td>Not teratogenic in rats, rabbits. Limited human experience, but other beta-lactam antibiotics have not been associated with adverse pregnancy outcomes.</td>
<td>Susceptible bacterial infections</td>
</tr>
<tr>
<td>Bedaquiline</td>
<td>B</td>
<td>Not teratogenic in rats, rabbits. No experience in human pregnancy.</td>
<td>Multidrug resistant TB when effective treatment regimen can not otherwise be provided.</td>
</tr>

<tr>
<td>Boceprevir</td>
<td>B</td>
<td>Not teratogenic in rats, rabbits. No human pregnancy data.</td>
<td>Treatment of HCV currently generally not indicated in pregnancy.</td>
</tr>
<tr>
<td>Capreomycin</td>
<td>C</td>
<td>Increase in skeletal variants in rats. Limited experience in human pregnancy; theoretical risk of fetal ototoxicity.</td>
<td>Drug-resistant TB</td>
</tr>
<tr>
<td>Caspofungin</td>
<td>C</td>
<td>Embryotoxic, skeletal defects in rats, rabbits. No experience with human use.</td>
<td>Invasive <em>Candida</em> or <em>Aspergillus</em> infections refractory to amphotericin and azoles</td>
</tr>
<tr>
<td>Cephalosporins</td>
<td>B</td>
<td>Not teratogenic in animals. Large experience in human pregnancy has not suggested increase in adverse outcomes.</td>
<td>Bacterial infections; alternate treatment for MAC</td>
</tr>
<tr>
<td>Chloroquine</td>
<td>C</td>
<td>Associated with anophthalmia, microophthalmia at tetotoxic doses in animals. Not associated with increased risk in human pregnancy at doses used for malaria.</td>
<td>Drug of choice for malaria prophylaxis and treatment of sensitive species in pregnancy.</td>
</tr>
<tr>
<td>Cidofovir</td>
<td>C</td>
<td>Embryotoxic and teratogenic (meningocele, skeletal abnormalities) in rats and rabbits. No experience in human pregnancy.</td>
<td>Not recommended</td>
</tr>
<tr>
<td>Ciprofloxacin, other quinolones</td>
<td>C</td>
<td>Arthropathy in immature animals; not embryotoxic or teratogenic in mice, rats, rabbits, or monkeys. More than 1100 cases of quinolone use in human pregnancy have not been associated with arthropathy or birth defects.</td>
<td>Severe MAC infections; multidrug resistant TB, anthrax, bacterial infections</td>
</tr>
<tr>
<td>Clarithromycin</td>
<td>C</td>
<td>Cardiovascular defects noted in one strain of rats and cleft palate in mice at high doses, not teratogenic in rabbits or monkeys. Two human studies, each with &gt;100 first-trimester exposures, did not show increase in defects but one study found an increase in spontaneous abortion.</td>
<td>Treatment or secondary MAC prophylaxis, if other choices exhausted</td>
</tr>
<tr>
<td>Clindamycin</td>
<td>B</td>
<td>No concerns specific to pregnancy in animal or human studies.</td>
<td>Treatment of anaerobic bacterial infections and used with quinine for chloroquineresistant malaria; alternate agent for secondary prophylaxis of <em>Toxoplasma</em> encephalitis</td>
</tr>
<tr>
<td>Clofazimine</td>
<td>C</td>
<td>Not teratogenic in mice, rats, or rabbits. Limited experience reported (19 cases); no anomalies noted but red-brown skin discoloration reported in several infants exposed throughout pregnancy.</td>
<td>No indications.</td>
</tr>
<tr>
<td>Clotrimazole troches</td>
<td>C</td>
<td>Not teratogenic in animals at exposures expected from treatment of oral or vaginal <em>Candida</em>. No increase in adverse pregnancy outcomes with vaginal use.</td>
<td>Oral or vaginal <em>Candida</em> infections and prophylaxis</td>
</tr>
<tr>
<td>Cycloserine</td>
<td>C</td>
<td>Not teratogenic in rats. No data available from human studies.</td>
<td>Drug-resistant TB</td>
</tr>

<td>C</td>
<td>Animal data do not suggest teratogenicity at human doses; limited experience in human pregnancy.</td>
<td>Not recommended because of limited data in pregnancy. Use as part of fully suppressive ARV regimen with ARV agents active against both HIV and HBV. Report exposures during pregnancy to Antiretroviral Pregnancy Registry: <a href="http://www.APRegistry.com">http://www.APRegistry.com</a>.</td>
</tr>
<tr>
<td>Erythromycin</td>
<td>B</td>
<td>Hepatotoxicity with erythromycin estolate in pregnancy; other forms acceptable; no evidence of teratogenicity</td>
<td>Bacterial and chlamydial infections</td>
</tr>
<tr>
<td>Ethambutol</td>
<td>B</td>
<td>Teratogenic, at high doses, in mice, rats, rabbits. No evidence of teratogenicity in 320 cases of human use for treatment of TB.</td>
<td>Active TB and MAC treatment; avoid in first trimester if possible</td>
</tr>
<tr>
<td>Ethionamide</td>
<td>C</td>
<td>Increased rate of defects (omphalocele, exencephaly, cleft palate) in rats, mice, and rabbits with high doses; not seen with usual human doses. Limited human data; case reports of CNS defects.</td>
<td>Active TB; avoid in first trimester if possible</td>
</tr>
<tr>
<td>Famciclovir</td>
<td>B</td>
<td>No evidence of teratogenicity in rats or rabbits, limited human experience.</td>
<td>Recurrent genital herpes and primary varicella infection. Report exposures during pregnancy to the Famvir Pregnancy Registry (1-888-669-6682).</td>
</tr>
<tr>
<td>Fluconazole</td>
<td>C</td>
<td>Abnormal ossification, structural defects in rats, mice at high doses. Case reports of rare pattern of craniofacial, skeletal and other abnormalities in five infants born to four women with prolonged exposure during pregnancy; no increase in defects seen in several series after single dose treatment.</td>
<td>Single dose may be used for treatment of vaginal Candida though topical therapy preferred. Not recommended for prophylaxis during early pregnancy. Can be used for invasive fungal infections after first trimester; amphotericin B preferred in first trimester if similar efficacy expected.</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td>Flucytosine</td>
<td>C</td>
<td>Facial clefts and skeletal defects in rats; cleft palate in mice, no defects in rabbits. No reports of use in first trimester of human pregnancy; may be metabolized to 5-fluorouracil, which is teratogenic in animals and possibly in humans.</td>
<td>Use after first trimester if indicated for lifethreatening fungal infections.</td>
</tr>
<tr>
<td>Fumagillin</td>
<td>Not FDA approved</td>
<td>Caused complete litter destruction or growth retardation in rats, depending on when administered. No data in human pregnancy.</td>
<td>Topical solution can be used for ocular microsporidial infections.</td>
</tr>
<tr>
<td>Ganciclovir, valganciclovir</td>
<td>C</td>
<td>Embryotoxic in rabbits and mice; teratogenic in rabbits (cleft palate, anophthalmia, aplastic kidney and pancreas, hydrocephalus). Case reports of safe use in human pregnancy after transplants, treatment of fetal CMV.</td>
<td>Treatment or secondary prophylaxis of lifethreatening or sight-threatening CMV infection. Preferred agent for therapy in children.</td>
</tr>
<tr>
<td>Imipenem, meropenem</td>
<td>C/B</td>
<td>Not teratogenic in animals; limited human experience.</td>
<td>Serious bacterial infections</td>
</tr>
<tr>
<td>Imiquimod</td>
<td>B</td>
<td>Not teratogenic in rats and rabbits; 8 case reports of human use, only 2 in first trimester.</td>
<td>Because of limited experience, other treatment modalities such as cryotherapy or trichloracetic acid recommended for wart treatment during pregnancy.</td>
</tr>
<tr>
<td>Influenza vaccine</td>
<td>C</td>
<td>Not teratogenic. Live vaccines, including intranasal influenza vaccine, are contraindicated in pregnancy.</td>
<td>All pregnant women should receive injectable influenza vaccine because of the increased risk of complications of influenza during pregnancy. Ideally, HIV-infected women should be on ART before vaccination to limit potential increases in HIV RNA levels with immunization.</td>
</tr>
<tr>
<td>Interferons (alfa, beta, gamma)</td>
<td>C</td>
<td>Abortifacient at high doses in monkeys, mice; not teratogenic in monkeys, mice, rats, or rabbits. Approximately 30 cases of use of interferon-alfa in pregnancy reported; 14 in first trimester without increase in anomalies; possible increased risk of intrauterine growth retardation.</td>
<td>Not indicated. Treatment of HCV currently generally not recommended in pregnancy.</td>
</tr>
<tr>
<td>Isoniazid</td>
<td>C</td>
<td>Not teratogenic in animals. Possible increased risk of hepatotoxicity during pregnancy; prophylactic pyridoxine, 50 mg/day, should be given to prevent maternal and fetal neurotoxicity.</td>
<td>Active TB; prophylaxis for exposure or skin test conversion</td>
</tr>
</tbody>

<tbody>
<tr>
<td>Itraconazole</td>
<td>C</td>
<td>Teratogenic in rats and mice at high doses. Case reports of craniofacial, skeletal abnormalities in humans with prolonged fluconazole exposure during pregnancy; no increase in defect rate noted among over 300 infants born after first-trimester itraconazole exposure.</td>
<td>Only for documented systemic fungal disease, not prophylaxis. Consider using amphotericin B in first trimester if similar efficacy expected.</td>
</tr>
<tr>
<td>Kanamycin</td>
<td>D</td>
<td>Associated with club feet in mice, inner ear changes in multiple species. Hearing loss in 2.3% of 391 children after long-term in utero therapy.</td>
<td>Drug-resistant TB</td>
</tr>
<tr>
<td>Ketoconazole</td>
<td>C</td>
<td>Teratogenic in rats, increased fetal death in mice, rabbits. Inhibits androgen and corticosteroid synthesis; may impact fetal male genital development; case reports of craniofacial, skeletal abnormalities in humans with prolonged fluconazole exposure during pregnancy.</td>
<td>None</td>
</tr>
<tr>
<td>Lamivudine</td>
<td>C</td>
<td>Not teratogenic in animals. No evidence of teratogenicity with &gt;3700 first-trimester exposures reported to Antiretroviral Pregnancy Registry.</td>
<td>HIV and HBV therapy, only as part of a fully suppressive combination ARV regimen. Report exposures to Antiretroviral Pregnancy Registry: <a href="http://www.APRegistry.com">http://www.APRegistry.com</a>.</td>
</tr>
<tr>
<td>Ledipasvir/sofosbuvir</td>
<td>B</td>
<td>No evidence of teratogenicity in rats or rabbits. No experience in human pregnancy</td>
<td>Treatment of hepatitis C generally not indicated in pregnancy.</td>
</tr>
<tr>
<td>Leucovorin (folic acid)</td>
<td>C</td>
<td>Prevents birth defects of valproic acid, methotrexate, phenytoin, aminopterin in animal models. No evidence of harm in human pregnancies.</td>
<td>Use with pyrimethamine if use of pyrimethamine cannot be avoided.</td>
</tr>
<tr>
<td>Linezolid</td>
<td>C</td>
<td>Not teratogenic in animals. Decreased fetal weight and neonatal survival at ~ human exposures, possibly related to maternal toxicity. Limited human experience.</td>
<td>Serious bacterial infections</td>
</tr>
<tr>
<td>Loperamide</td>
<td>B</td>
<td>Not teratogenic in animals. No increase in birth defects among infants born to 89 women with first-trimester exposure in one study; another study suggests a possible increased risk of hypospadias with first-trimester exposure, but confirmation required.</td>
<td>Symptomatic treatment of diarrhea after the first trimester</td>
</tr>
<tr>
<td>Mefloquine</td>
<td>C</td>
<td>Animal data and human data do not suggest an increased risk of birth defects, but miscarriage and stillbirth may be increased.</td>
<td>Second-line therapy of chloroquine-resistant malaria in pregnancy, if quinine/clindamycin not available or not tolerated. Weekly as prophylaxis in areas with chloroquine-resistant malaria.</td>
</tr>
<tr>
<td>Meglumine</td>
<td>Not FDA approved</td>
<td>See Antimonials, pentavalent</td>
<td>Anaerobic bacterial infections, bacterial vaginosis, trichomoniasis, giardiasis, amebiasis</td>
</tr>
<tr>
<td>Metronidazole</td>
<td>B</td>
<td>Multiple studies do not indicate teratogenicity. Studies on several hundred women with first trimester exposure found no increase in birth defects.</td>
<td></td>
</tr>
<tr>
<td>Micafungin</td>
<td>C</td>
<td>Teratogenic in rabbits; no human experience.</td>
<td>Not recommended</td>
</tr>
</tbody>
</table>

<tr>
<td>Miltefosine</td>
<td>Not FDA approved</td>
<td>Embryotoxic in rats, rabbits; teratogenic in rats. No experience with human use.</td>
<td>Not recommended</td>
</tr>
<tr>
<td>Nifurtimox</td>
<td>Not FDA approved</td>
<td>Not teratogenic in mice and rats. Increased chromosomal aberrations in children receiving treatment; uncertain significance. No experience in human pregnancy.</td>
<td>Not indicated in chronic infection; seek expert consultation if acute infection or symptomatic reactivation of <em>T. cruzi</em> in pregnancy.</td>
</tr>
<tr>
<td>Nitazoxanide</td>
<td>B</td>
<td>Not teratogenic in animals; no human data</td>
<td>Severely symptomatic cryptosporidiosis after the first trimester</td>
</tr>
<tr>
<td>Para-amino salicylic acid (PAS)</td>
<td>C</td>
<td>Occipital bone defects in one study in rats; not teratogenic in rabbits. Possible increase in limb, ear anomalies in one study with 143 first-trimester exposures; no specific pattern of defects noted, several studies did not find increased risk.</td>
<td>Drug-resistant TB</td>
</tr>
<tr>
<td>Paromomycin</td>
<td>C</td>
<td>Not teratogenic in mice and rabbits. Limited human experience, but poor oral absorption makes toxicity, teratogenicity unlikely.</td>
<td>Amebic intestinal infections, possibly cryptosporidiosis</td>
</tr>
<tr>
<td>Penicillin</td>
<td>B</td>
<td>Not teratogenic in multiple animal species. Vast experience with use in human pregnancy does not suggest teratogenicity, other adverse outcomes.</td>
<td>Syphilis, other susceptible bacterial infections</td>
</tr>
<tr>
<td>Pentamidine</td>
<td>C</td>
<td>Embryocidal but not teratogenic in rats, rabbits with systemic use. Limited experience with systemic use in pregnancy.</td>
<td>Alternate therapy for PCP and leishmaniasis.</td>
</tr>
<tr>
<td>Piperacillin-tazobactam</td>
<td>B</td>
<td>Not teratogenic in limited animal studies. Limited experience in pregnancy but penicillins generally considered safe.</td>
<td>Bacterial infections</td>
</tr>
<tr>
<td>Pneumococcal vaccine</td>
<td>C</td>
<td>No studies in animal pregnancy. Polysaccharide vaccines generally considered safe in pregnancy. Well-tolerated in third-trimester studies.</td>
<td>Initial or booster dose for prevention of invasive pneumococcal infections. HIV infected pregnant women should be on ART before vaccination to limit potential increases in HIV RNA levels with immunization.</td>
</tr>
<tr>
<td>Podophyllin, podofilox</td>
<td>C</td>
<td>Increased embryonic and fetal deaths in rats, mice but not teratogenic. Case reports of maternal, fetal deaths after use of podophyllin resin in pregnancy; no clear increase in birth defects with first-trimester exposure.</td>
<td>Because alternative treatments for genital warts in pregnancy are available, use not recommended; inadvertent use in early pregnancy is not indication for abortion.</td>
</tr>
<tr>
<td>Posaconazole</td>
<td>C</td>
<td>Embryotoxic in rabbits; teratogenic in rats at similar to human exposures. No experience in human pregnancy.</td>
<td>Not recommended</td>
</tr>
<tr>
<td>Prednisone</td>
<td>B</td>
<td>Dose-dependent increased risk of cleft palate in mice, rabbits, hamsters; dose-dependent increase in genital anomalies in mice. Human data inconsistent regarding increased risk of cleft palate. Risk of growth retardation, low birth weight may be increased with chronic use; monitor for hyperglycemia with use in third trimester.</td>
<td>Adjunctive therapy for severe PCP; multiple other non-HIV-related indications</td>
</tr>
</tbody>
</table>

<tbody>
<tr>
<td>Primaquine</td>
<td>C</td>
<td>No animal data. Limited experience with use in human pregnancy; theoretical risk for hemolytic anemia if fetus has G6PD deficiency.</td>
<td>Alternate therapy for PCP, chloroquine-resistant malaria</td>
</tr>
<tr>
<td>Proguanil</td>
<td>C</td>
<td>Not teratogenic in animals. Widely used in malaria-endemic areas with no clear increase in adverse outcomes.</td>
<td>Alternate therapy and prophylaxis of <em>P. falciparum</em> malaria</td>
</tr>
<tr>
<td>Pyrazinamide</td>
<td>C</td>
<td>Not teratogenic in rats, mice. Limited experience with use in human pregnancy.</td>
<td>Active TB</td>
</tr>
<tr>
<td>Pyrimethamine</td>
<td>C</td>
<td>Teratogenic in mice, rats, hamsters (cleft palate, neural tube defects, and limb anomalies). Limited human data have not suggested an increased risk of birth defects; because folate antagonist, use with leucovorin.</td>
<td>Treatment and secondary prophylaxis of toxoplastic encephalitis; alternate treatment of PCP</td>
</tr>
<tr>
<td>Quinidine gluconate</td>
<td>C</td>
<td>Generally considered safe in pregnancy; high doses associated with preterm labor. One case of fetal 8th nerve damage reported.</td>
<td>Alternate treatment of malaria, control of fetal arrhythmias</td>
</tr>
<tr>
<td>Quinine sulfate</td>
<td>C</td>
<td>High doses, often taken as an abortifacient, have been associated with birth defects, especially deafness, in humans and animals. Therapeutic doses have not been associated with an increased risk of defects in humans or animals. Monitor for hypoglycemia.</td>
<td>Treatment of chloroquine-resistant malaria</td>
</tr>
<tr>
<td>Ribavirin</td>
<td>X</td>
<td>Dose-dependent risk of multiple defects (craniofacial, central nervous system, skeletal, anophthalmia) in rats, mice, hamsters starting at below human doses. Reports of treatment during second half of pregnancy in nine women without incident; first 49 cases in registry did not suggest increased risk, but limited data.</td>
<td>Contraindicated in early pregnancy; no clear indications in pregnancy. Report exposures during pregnancy to Ribavirin Pregnancy Registry at (800) 593-2214 or <a href="http://www.ribavirinpregnancyregistry.com">www.ribavirinpregnancyregistry.com</a></td>
</tr>
<tr>
<td>Rifabutin</td>
<td>B</td>
<td>Not teratogenic in rats and rabbits; no specific concerns for human pregnancy.</td>
<td>Treatment or prophylaxis of MAC, active TB</td>
</tr>
<tr>
<td>Rifampin</td>
<td>C</td>
<td>Teratogenic at high doses in mice (cleft palate) and rats (spina bifida) but not in rabbits. No clear teratogenicity in humans.</td>
<td>Active TB</td>
</tr>
<tr>
<td>Simeprevir</td>
<td>C</td>
<td>Decreased fetal weights and increased skeletal variants in mice at 4x human exposure. Increased deaths and decreased fetal and neonatal growth and developmental delay after in utero exposure in rats. No experience in human pregnancy.</td>
<td>Treatment of HCV currently generally not recommended in pregnancy.</td>
</tr>
<tr>
<td>Sinecatechin ointment</td>
<td>C</td>
<td>No evidence of teratogenicity in rats and rabbits after oral or intravaginal dosing. No experience in human pregnancy.</td>
<td>Not recommended based on lack of data.</td>
</tr>
<tr>
<td>Sofobusvir</td>
<td>B</td>
<td>No evidence of teratogenicity in rats or rabbits. No experience in human pregnancy.</td>
<td>Treatment of HCV generally not indicated in pregnancy. Regimens including ribavirin and interferon are contraindicated in pregnancy.</td>

<tr>
<td>Streptomycin</td>
<td>D</td>
<td>No teratogenicity in mice, rats, guinea pigs. Possible increased risk of deafness and VIII nerve damage; no evidence of other defects.</td>
<td>Alternate therapy for active TB</td>
</tr>
<tr>
<td>Sulfadiazine</td>
<td>B</td>
<td>Sulfonamides teratogenic in some animal studies. No clear teratogenicity in humans; potential for increased jaundice, kernicterus if used near delivery.</td>
<td>Secondary prophylaxis of toxoplasmic encephalitis</td>
</tr>
<tr>
<td>Telaprevir</td>
<td>B</td>
<td>Not teratogenic in mice, rats. No human pregnancy data.</td>
<td>Treatment of HCV currently generally not indicated in pregnancy.</td>
</tr>
<tr>
<td>Tenofovir</td>
<td>B</td>
<td>No evidence of birth defects in rats, rabbits, or monkeys at high doses; chronic administration in immature animals of multiple species at 6–50 times human doses has led to dose-specific bone changes ranging from decreased mineral density to severe osteomalacia and fractures. Clinical studies in humans (particularly children) show bone demineralization with chronic use; clinical significance unknown. No evidence of increased birth defects in nearly 2000 first-trimester exposures in women.</td>
<td>Component of fully suppressive antiretroviral regimen in pregnant women. Report exposures during pregnancy to Antiretroviral Pregnancy Registry: <a href="http://www.APRegistry.com">http://www.APRegistry.com</a>.</td>
</tr>
<tr>
<td>Trichloracetic acid, bichloracetic acid</td>
<td>Not rated</td>
<td>No studies. Used topically so no systemic absorption expected.</td>
<td>Topical therapy of non-cervical genital warts</td>
</tr>
<tr>
<td>Trifluridine</td>
<td>C</td>
<td>Not teratogenic in rats, rabbits. Minimal systemic absorption expected with topical ocular use.</td>
<td>Topical agent for treatment of ocular herpes infections</td>
</tr>
<tr>
<td>Trimethoprim-sulfamethoxazole</td>
<td>C</td>
<td>Teratogenic in rats and mice. Possible increase in congenital cardiac defects, facial clefts, neural tube and urinary defects with first-trimester use. Unclear if higher levels of folate supplementation lower risk. Theoretical risk of elevated bilirubin in the neonate if used near delivery.</td>
<td>Therapy of PCP during pregnancy. Primary and secondary PCP prophylaxis in the second/third trimester; consider aerosolized pentamidine in first trimester. Recommend fetal ultrasound at 18–20 weeks after first trimester exposure.</td>
</tr>
<tr>
<td>Valacyclovir</td>
<td>B</td>
<td>Not teratogenic in mice, rats, and rabbits. Experience with valacyclovir in pregnancy limited; prodrug of acyclovir, which is considered safe for use in pregnancy.</td>
<td>Treatment of HSV and varicella infections in pregnancy</td>
</tr>
<tr>
<td>Vancomycin</td>
<td>C</td>
<td>Not teratogenic in rats, rabbits. Limited human experience.</td>
<td>Serious bacterial infections</td>
