<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Disseminated <em>Mycobacterium avium</em> complex (MAC) disease</td>
<td>CD4 count &lt;50 cells/µL—after ruling out active disseminated MAC disease based on clinical assessment (AI).</td>
<td>• Azithromycin 1200 mg PO once weekly (AI), or • Clarithromycin 500 mg PO BID (AI), or • Azithromycin 600 mg PO twice weekly (BIII)</td>
<td>Rifabutin (dose adjusted based on concomitant ART) (BI); rule out active TB before starting rifabutin.</td>
</tr>
<tr>
<td>Streptococcus pneumoniae infection</td>
<td>For individuals who have not received any pneumococcal vaccine, regardless of CD4 count, followed by: • if CD4 count ≥200 cells/µL • if CD4 count &lt;200 cells/µL</td>
<td>PCV13 0.5 mL IM x 1 (AI).</td>
<td>PPV23 0.5 mL IM x 1 (BII)</td>
</tr>
<tr>
<td>Streptococcus pneumoniae infection</td>
<td>For individuals who have previously received PPV23</td>
<td>One dose of PCV13 should be given at least 1 year after the last receipt of PPV23 (AI).</td>
<td></td>
</tr>
<tr>
<td>Streptococcus pneumoniae infection</td>
<td>Re-vaccination • If age 19–64 years and ≥5 years since the first PPV23 dose • If age ≥65 years, and if ≥5 years since the previous PPV23 dose</td>
<td>• PPV23 0.5 mL IM or SQ x 1 (BIII) • PPV23 0.5 mL IM or SQ x 1 (BIII)</td>
<td></td>
</tr>
<tr>
<td>Influenza A and B virus infection</td>
<td>All HIV-infected patients (AIII)</td>
<td>Inactivated influenza vaccine annually (per recommendation for the season) (AIII)</td>
<td>Live-attenuated influenza vaccine is contraindicated in HIV-infected patients (AIII).</td>
</tr>
<tr>
<td>Syphilis</td>
<td>• For individuals exposed to a sex partner with a diagnosis of primary, secondary, or early latent syphilis within past 90 days (AII), or • For individuals exposed to a sex partner &gt;90 days before syphilis diagnosis in the partner, if serologic test results are not available immediately and the opportunity for follow-up is uncertain (AII)</td>
<td>Benzathine penicillin G 2.4 million units IM for 1 dose (AII)</td>
<td>For penicillin-allergic patients: • Doxycycline 100 mg PO BID for 14 days (BII), or • Ceftriaxone 1 g IM or IV daily for 8–10 days (BII), or • Azithromycin 2 g PO for 1 dose (BII) – not recommended for MSM or pregnant women (AII)</td>
</tr>
<tr>
<td>Histoplasma capsulatum infection</td>
<td>CD4 count ≤150 cells/µL and at high risk because of occupational exposure or live in a community with a hyperendemic rate of histoplasmosis (&gt;10 cases/100 patient-years) (BI)</td>
<td>Itraconazole 200 mg PO daily (BI)</td>
<td></td>
</tr>

<tbody>
<tr>
<td>Coccidioidomycosis</td>
<td>A new positive IgM or IgG serologic test in patients who live in a disease-endemic area and with CD4 count &lt;250 cells/µL (BIII)</td>
<td>Fluconazole 400 mg PO daily (BIII)</td>
<td></td>
</tr>
<tr>
<td>Varicella-zoster virus (VZV) infection</td>
<td>Pre-exposure prevention: Patients with CD4 counts ≥200 cells/µL who have not been vaccinated, have no history of varicella or herpes zoster, or who are seronegative for VZV (CIII). <strong>Note:</strong> Routine VZV serologic testing in HIV-infected adults and adolescents is not recommended. Post-exposure prevention: (AIII) Close contact with a person with chickenpox or herpes zoster; and is susceptible (i.e., no history of vaccination or of either condition, or known to be VZV seronegative)</td>
<td>Pre-exposure prevention: Primary varicella vaccination (Varivax™), 2 doses (0.5 mL SQ each) administered 3 months apart (CIII). If vaccination results in disease because of vaccine virus, treatment with acyclovir is recommended (AIII). Post-exposure prevention: Varicella-zoster immune globulin (VariZIG™) 125 international units per 10 kg (maximum 625 international units) IM, administered as soon as possible and within 10 days after exposure (AIII) <strong>Note:</strong> VariZIG is exclusively distributed by FFF Enterprises at 800-843-7477. Individuals receiving monthly high-dose IVIG (&gt;400 mg/kg) are likely to be protected if the last dose of IVIG was administered &lt;3 weeks before exposure.</td>
<td>Pre-exposure prevention: VZV-susceptible household contacts of susceptible HIV-infected persons should be vaccinated to prevent potential transmission of VZV to their HIV-infected contacts (BIII). Alternative post-exposure prevention: • Acyclovir 800 mg PO 5 x/day for 5–7 days (BIII), or • Valacyclovir 1 g PO TID for 5–7 days (BIII) These alternatives have not been studied in the HIV population. If antiviral therapy is used, varicella vaccines should not be given until at least 72 hours after the last dose of the antiviral drug.</td>
</tr>
<tr>
<td>Human Papillomavirus (HPV) infection</td>
<td>Females aged 13–26 years (BIII)</td>
<td>• HPV quadrivalent vaccine 0.5 mL IM at months 0, 1–2, and 6 (BIII), or • HPV bivalent vaccine 0.5 mL IM at months 0, 1–2, and 6 (BIII), or • HPV 9-valent vaccine 0.5 mL IM at months 0, 1–2, and 6 (BIII)</td>
<td>• HPV quadrivalent vaccine 0.5 mL IM at months 0, 1–2, and 6 (BIII), or • HPV 9-valent vaccine 0.5 mL IM at months 0, 1–2, and 6 (BIII)</td>
</tr>
<tr>
<td></td>
<td>Males aged 13–26 years (BIII)</td>

<table>
<thead>
<tr>
<th>Opportunistic Infections</th>
<th>Indication</th>
<th>Preferred</th>
<th>Alternative</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hepatitis A virus (HAV) infection</td>
<td>HAV-susceptible patients with chronic liver disease, or who are injection-drug users, or MSM (AII).</td>
<td>Hepatitis A vaccine 1 mL IM x 2 doses at 0 and 6–12 months (AII). IgG antibody response should be assessed 1 month after vaccination; non-responders should be revaccinated when CD4 count &gt;200 cells/µL. (BIII).</td>
<td>For patients susceptible to both HAV and hepatitis B virus (HBV) infection (see below): Combined HAV and HBV vaccine (Twinrix®), 1 mL IM as a 3-dose (0, 1, and 6 months) or 4-dose series (days 0, 7, 21 to 30, and 12 months) (AII).</td>
</tr>
<tr>
<td>Hepatitis B virus (HBV) infection</td>
<td>• Patients without chronic HBV or without immunity to HBV (i.e., with anti-HBs &lt;10 IU/mL) (AII) • Patients with isolated anti-HBc: vaccinate with 1 standard dose of HBV vaccine, check anti-HBs 1–2 months after, if &gt;100 IU, no further vaccination needed. If titer is &lt;100IU, vaccinate with full series (BII) • Early vaccination is recommended before CD4 count falls below 350 cells/µL (AII). • However, in patients with low CD4 cell counts, vaccination should not be deferred until CD4 count reaches &gt;350 cells/µL, because some patients with CD4 counts &lt;200 cells/µL do respond to vaccination (AII).</td>
<td>• HBV vaccine IM (Engerix-B 20 µg/mL or Recombivax HB 10 µg/mL), 0, 1, and 6 months (AII), or • HBV vaccine IM (Engerix-B 40 µg/mL or Recombivax HB 20 µg/mL), 0, 1, 2 and 6 months (BII), • Combined HAV and HBV vaccine (Twinrix®), 1 mL IM as a 3-dose (0, 1, and 6 months) or 4-dose series (days 0, 7, 21 to 30, and 12 months) (AII) Anti-HBs should be obtained 1–2 months after completion of the vaccine series. Patients with anti-HBs &lt;10 IU/mL are considered non-responders, and should be revaccinated with another 3-dose series (BIII).</td>
<td>Some experts recommend vaccinating with 4-doses of double dose of either HBV vaccine (BII).</td>
</tr>
<tr>
<td>Vaccine Non-Responders:</td>
<td>• Anti-HBs &lt;10 international units/mL 1 month after vaccination series • For patients with low CD4 counts at time of first vaccine series, some experts might delay revaccination until after a sustained increase in CD4 count with ART (CIII).</td>
<td>Re-vaccinate with a second vaccine series (BIII) • HBV vaccine IM (Engerix-B 40 µg/mL or Recombivax HB 20 µg/mL), 0, 1, 2 and 6 months (BII).</td>
<td></td>
</tr>
<tr>
<td>Malaria</td>
<td>Travel to disease-endemic area</td>
<td>Recommendations are the same for HIV-infected and HIV-uninfected patients. Recommendations are based on region of travel, malaria risks, and drug susceptibility in the region. Refer to the following website for the most recent recommendations based on region and drug susceptibility: <a href="http://www.cdc.gov/malaria/">http://www.cdc.gov/malaria/</a>.</td>

</tr>
</thead>
<tbody>
<tr>
<td>Penicilliosis</td>
<td>Patients with CD4 cell counts &lt;100 cells/µL who live or stay for a long period in rural areas in northern Thailand, Vietnam, or Southern China (BI)</td>
<td>Itraconazole 200 mg once daily (BI)</td>
<td>Fluconazole 400 mg PO once weekly (BII)</td>
</tr>
</tbody>
</table>

**Key to Acronyms:** anti-HBc = hepatitis B core antibody; anti-HBs = hepatitis B surface antibody; ART = antiretroviral therapy; BID = twice daily; BIW = twice a week; CD4 = CD4 T lymphocyte cell; DOT = directly observed therapy; DS = double strength; HAV = hepatitis A virus; HBV = hepatitis B virus; HPV = human papillomavirus; IgG = immunoglobulin G; IgM = immunoglobulin M; IM = intramuscular; INH = isoniazid; IV = intravenously; IVIG = intravenous immunoglobulin; LTBI = latent tuberculosis infection; MAC = *Mycobacterium avium* complex; PCP = *Pneumocystis* pneumonia; PCV13 = 13-valent pneumococcal conjugate vaccine; PO = orally; PPV23 = 23-valent pneumococcal polysaccharides vaccine; SQ = subcutaneous; SS = single strength; TB = tuberculosis; TMP-SMX = Trimethoprim-sulfamethoxazole; VZV = varicella zoster virus

a TMP-SMX DS once daily also confers protection against toxoplasmosis and many respiratory bacterial infections; lower dose also likely confers protection

b Patients should be tested for glucose-6-phosphate dehydrogenase (G6PD) before administration of dapsone or primaquine. Alternative agent should be used in patients found to have G6PD deficiency

c Screening tests for LTBI include tuberculin skin test (TST) or interferon-gamma release assays (IGRA)
d Refer to the Drug Interactions section in the Adult and Adolescent ARV Guidelines for dosing recommendation

**Evidence Rating:**

**Strength of Recommendation:**
- A: Strong recommendation for the statement
- B: Moderate recommendation for the statement
- C: Optional recommendation for the statement

**Quality of Evidence for the Recommendation:**
- I: One or more randomized trials with clinical outcomes and/or validated laboratory endpoints
- II: One or more well-designed, nonrandomized trials or observational cohort studies with long-term clinical outcomes
- III: Expert opinion

In cases where there are no data for the prevention or treatment of an OI based on studies conducted in HIV-infected populations, but data derived from HIV-uninfected patients exist that can plausibly guide management decisions for patients with HIV/AIDS, the data will be rated as III but will be assigned recommendations of A, B, C depending on the strength of recommendation.

| Microsporidiosis        | For GI Infections Caused by Enterocytozoon bieneusi:  
  • Initiate or optimize ART as immune restoration to CD4 count >100 cells/µL (AII); plus  
  • Manage severe dehydration, malnutrition, and wasting by fluid support (AII) and nutritional supplement (AIII)  
For Intestinal and Disseminated (Not Ocular) Infections Caused by Microsporidia Other Than E. bieneusi and Vittaforma cornea:  
  • Albendazole 400 mg PO BID (AII), continue until CD4 count >200 cells/µL for >6 months after initiation of ART (BIII)  
For Ocular Infection:  
  • Topical fumagillin bicyclohexylammonium (Fumidil B) eye drops: 3 mg/mL in saline (fumagillin 70 µg/mL)—2 drops q2h for 4 days, then 2 drops QID (investigational use only in United States) (BII) + albendazole 400 mg PO BID, for management of systemic infection (BIII)  
  • Therapy should be continued until resolution of ocular symptoms and CD4 count increase to >200 cells/µL for >6 months in response to ART (CIII). | For GI Infections Caused by E. bieneusi:  
  • Fumagillin 60 mg/day (BII) and TNP-470 (a synthetic analog of fumagillin) (BIII) may be effective, but neither is available in the United States.  
  • Nitazoxanide (1000 mg BID) may have some effect but response may be minimal in patients with low CD4 cell counts (CIII).  
For Disseminated Disease Attributed to Trachipleistophora or Annellia:  
  • Itraconazole 400 mg PO daily + albendazole 400 mg PO BID (CIII) | Anti-motility agents can be used for diarrhea control if required (BIII). |
### Mycobacterium tuberculosis (TB) Disease

<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
|                         | After collecting specimen for culture and molecular diagnostic tests, empiric TB treatment should be started in individuals with clinical and radiographic presentation suggestive of TB (AIII). Refer to Table 3 for dosing recommendations. | Treatment for Drug-Resistant TB
Resistant to INH:
• (RIF or RFB) + EMB + PZA + (moxifloxacin or levofloxacin) for 2 months (BII); followed by (RIF or RFB) + EMB + (moxifloxacin or levofloxacin) for 7 months (BII)
Resistant to Rifamycins +/- Other Drugs:
• Regimen and duration of treatment should be individualized based on resistance pattern, clinical and microbiological responses, and in close consultation with experienced specialists (AIII). | Adjunctive corticosteroid improves survival for TB meningitis and pericarditis (AI).
See text for drug, dose, and duration recommendations. All rifamycins may have significant pharmacokinetic interactions with antiretroviral drugs, please refer to the Drug Interactions section in the Adult and Adolescent ARV Guidelines for dosing recommendations. Therapeutic drug monitoring should be considered in patients receiving rifamycin and interacting ART. Paradoxical IRIS that is not severe can be treated with NSAIDs without a change in TB or HIV therapy (BIII). For severe IRIS reaction, consider prednisone and taper over 4 weeks based on clinical symptoms (BIII). For example:
• If receiving RIF: prednisone 1.5 mg/kg/day for 2 weeks, then 0.75 mg/kg/day for 2 weeks
• If receiving RFB: prednisone 1.0 mg/kg/day for 2 weeks, then 0.5 mg/kg/day for 2 weeks
A more gradual tapering schedule over a few months may be necessary for some patients. |

#### Initial Phase (2 Months, Given Daily, 5–7 Times/Week by DOT) (AI):
• INH + [RIF or RFB] + PZA + EMB (AII),
Continuation Phase:
• INH + (RIF or RFB) daily (5–7 times/week) (AIII)

#### Total Duration of Therapy (For Drug-Susceptible TB):
• Pulmonary drug-susceptible TB: 6 months (BII)
• Pulmonary TB and culture-positive after 2 months of TB treatment: 9 months (BII)
• Extra-pulmonary TB w/CNS infection: 9–12 months (BII);
• Extra-pulmonary TB w/bone or joint involvement: 6 to 9 months (BII);
• Extra-pulmonary TB in other sites: 6 months (BII)
Total duration of therapy should be based on number of doses received, not on calendar time
<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| **Disseminated Mycobacterium avium Complex (MAC) Disease** | At Least 2 Drugs as Initial Therapy. With:  
• Clarithromycin 500 mg PO BID (AI) + ethambutol 15 mg/kg PO daily (AI), or  
• (Azithromycin 500–600 mg + ethambutol 15 mg/kg) PO daily (AI) if drug interaction or intolerance precludes the use of clarithromycin | Addition of a third or fourth drug should be considered for patients with advanced immunosuppression (CD4 counts <50 cells/µL), high mycobacterial loads (>2 log CFU/mL of blood), or in the absence of effective ART (CIII).  
Third or Fourth Drug Options May Include:  
• RFB 300 mg PO daily (dosage adjustment may be necessary based on drug interactions) (CI).  
• Amikacin 10–15 mg/kg IV daily (CIII) or Streptomycin 1 g IV or IM daily (CIII), or  
• Moxifloxacin 400 mg PO daily (CII) or Levofloxacin 500 mg PO daily (CII) | Testing of susceptibility to clarithromycin and azithromycin is recommended (BII).  
NSAIDs can be used for patients who experience moderate to severe symptoms attributed to IRIS (CIII).  
If IRIS symptoms persist, short-term (4–8 weeks) systemic corticosteroids (equivalent to 20–40 mg prednisone) can be used (CIII). |
| **Bacterial Respiratory Diseases (with focus on pneumonia)** | Empiric Outpatient Therapy:  
• A PO beta-lactam + a PO macrolide (azithromycin or clarithromycin) (AI)  
  • Preferred beta-lactams: high-dose amoxicillin or amoxicillin/clavulanate  
  • Alternative beta-lactams: cefpodoxime or cefuroxime, or  
• For penicillin-allergic patients: Levofloxacin 750 mg PO once daily (AI), or moxifloxacin 400 mg PO once daily (AI) | Empiric Outpatient Therapy:  
• A PO beta-lactam + PO doxycycline (CII)  
  • Preferred beta-lactams: high-dose amoxicillin or amoxicillin/clavulanate  
  • Alternative beta-lactams: cefpodoxime or cefuroxime  
Empiric Therapy for Non-ICU Hospitalized Patients:  
• An IV beta-lactam + doxycycline (CIII)  
Empiric Therapy For ICU Patients:  
• For penicillin-allergic patients: Aztreonam IV + (levofloxacin 750 mg IV once daily or moxifloxacin 400 mg IV once daily) (BII)  
Empiric Therapy For Patients at Risk of Pseudomonas Pneumonia:  
• An IV antipseudomonal, antipseudomonal beta-lactam + an aminoglycoside + azithromycin (BII), or  
• Above beta-lactam + an aminoglycoside + (levofloxacin 750 mg IV once daily or moxifloxacin 400 mg IV once daily) (BII), or  
• For penicillin-allergic patients: Replace the beta-lactam with aztreonam (BII). | Fluooroquinolones should be used with caution in patients in whom TB is suspected but is not being treated.  
Empiric therapy with a macrolide alone is not routinely recommended, because of increasing pneumococcal resistance (BII).  
Patients receiving a macrolide for MAC prophylaxis should not receive macrolide monotherapy for empiric treatment of bacterial pneumonia.  
For patients begun on IV antibiotic therapy, switching to PO should be considered when they are clinically improved and able to tolerate oral medications.  
Chemoprophylaxis can be considered for patients with frequent recurrences of serious bacterial pneumonia (CIII).  
Clinicians should be cautious about using antibiotics to prevent recurrences because of the potential for developing drug resistance and drug toxicities. |

<tbody>
<tr>
<td><strong>Bacterial Enteric Infections:</strong> Empiric Therapy pending definitive diagnosis.</td>
<td>Diagnostic fecal specimens should be obtained before initiation of empiric antibiotic therapy. If culture is positive, antibiotic susceptibilities should be performed to inform antibiotic choices given increased reports of antibiotic resistance. If a culture independent diagnostic test is positive, reflex cultures for antibiotic susceptibilities should also be done. Empiric antibiotic therapy is indicated for advanced HIV patients (CD4 count &lt;200 cells/µL or concomitant AIDS-defining illnesses), with clinically severe diarrhea (≥6 stools/day or bloody stool) and/or accompanying fever or chills. Empiric Therapy: • Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (AIII) Therapy should be adjusted based on the results of diagnostic work-up. For patients with chronic diarrhea (&gt;14 days) without severe clinical signs, empiric antibiotics therapy is not necessary, can withhold treatment until a diagnosis is made.</td>
<td>Empiric Therapy: • Ceftriaxone 1 g IV q24h (BIII), or • Cefotaxime 1 g IV q8h (BIII)</td>
<td>Oral or IV rehydration (if indicated) should be given to patients with diarrhea (AIII). Antimotility agents should be avoided if there is concern about inflammatory diarrhea, including <em>Clostridium difficile</em>–associated diarrhea (BIII). If no clinical response after 3-4 days, consider follow-up stool culture with antibiotic susceptibility testing or alternative diagnostic tests (e.g., toxin assays, molecular testing) to evaluate alternative diagnosis, antibiotic resistance, or drug-drug interactions. IV antibiotics and hospitalization should be considered in patients with marked nausea, vomiting, diarrhea, electrolyte abnormalities, acidosis, and blood pressure instability.</td>
</tr>
<tr>
<td><strong>Salmonellosis</strong></td>
<td>All HIV-infected patients with salmonellosis should receive antimicrobial treatment due to an increase of bacteremia (by 20-100 fold) and mortality (by up to 7-fold) compared to HIV-negative individuals (AIII).</td>
<td>• Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h, if susceptible (AIII) Duration of Therapy: For gastroenteritis without bacteremia: • If CD4 count ≥200 cells/µL: 7–14 days (BIII) • If CD4 count &lt;200 cells/µL: 2–6 weeks (BIII) For gastroenteritis with bacteremia: • If CD4 count ≥200/µL: 14 days or longer duration if bacteremia persists or if the infection is complicated (e.g., if metastatic foci of infection are present) (BIII) • If CD4 count &lt;200 cells/µL: 2–6 weeks (BIII)</td>
<td>• Levofloxacin 750 mg (PO or IV) q24h (BIII), or • Moxifloxacin 400 mg (PO or IV) q24h (BIII), or • TMP 160 mg-SMX 800 mg (PO or IV) q12h (BIII), or • Ceftriaxone 1 g IV q24h (BIII), or • Cefotaxime 1 g IV q8h (BIII)</td>
</tr>

</tbody>
</table>
| Campylobacteriosis, continued | **Duration of Therapy:**  
- **Gastroenteritis:** 7–10 days (AIII) (5 days with azithromycin)  
- **Bacteremia:** ≥14 days (BIII)  
- **Recurrent bacteremia:** 2–6 weeks (BIII) | For mild, outpatient disease: metronidazole 500 mg (PO) TID for 10–14 days (CII). | Effective ART may reduce the frequency, severity, and recurrence of campylobacter infections. |
| **Clostridium difficile infection (CDI)** | Vancomycin 125 mg (PO) QID for 10–14 days (AI)  
For severe, life-threatening CDI, see text and references for additional information. | | Recurrent CDI: Treatment is the same as in patients without HIV infection. Fecal microbiota therapy may be successful and safe to treat recurrent CDI in HIV-infected patients (CIII). See text and references for additional information. |
| Bartonellosis | **For Bacillary Angiomatosis, Peliosis Hepatis, Bacteremia, and Osteomyelitis:**  
- Doxycycline 100 mg PO or IV q12h (AII), or  
- Erythromycin 500 mg PO or IV q6h (AII)  
**CNS Infections:**  
- (Doxycycline 100 mg +/- RIF 300 mg) PO or IV q12h (AIII)  
**Confirmed Bartonella Endocarditis:**  
- (Doxycycline 100 mg IV q12h + gentamicin 1 mg/kg IV q8h) for 2 weeks, then continue with doxycycline 100 mg IV or PO q12h (BII)  
**Other Severe Infections:**  
- (Doxycycline 100 mg PO or IV +/- RIF 300 mg PO or IV) q12h (BIII), or  
- (Erythromycin 500 mg PO or IV q6h) +/- RIF 300 mg PO or IV q12h (BIII) | For Bacillary Angiomatosis, Peliosis Hepatis, Bacteremia, And Osteomyelitis:  
- Azithromycin 500 mg PO daily (BIII)  
- Clarithromycin 500 mg PO BID (BIII)  
**Confirmed Bartonella Endocarditis but with Renal Insufficiency:**  
- (Doxycycline 100 mg IV + RIF 300 mg PO or IV) q12h for 2 weeks, then continue with doxycycline 100 mg IV or PI q12h (BII) | When RIF is used, take into consideration the potential for significant interaction with ARV drugs and other medications (see Table 5 for dosing recommendations).  
If relapse occurs after initial (>3 month) course of therapy, long-term suppression with doxycycline or a macrolide is recommended as long as CD4 count <200 cells/µL (AIII). |

</thead>
</table>
| Mucocutaneous candidiasis | For Oropharyngeal Candidiasis: Initial Episodes (For 7–14 Days):  
  Oral Therapy  
  - Fluconazole 100 mg PO daily (AI), or  
  Topical Therapy  
  - Clotrimazole troches, 10 mg PO 5 times daily (BI), or  
  - Miconazole mucoadhesive buccal 50-mg tablet—apply to mucosal surface over the canine fossa once daily (do not swallow, chew, or crush) (BI)  
For Esophageal Candidiasis (For 14–21 Days):  
  - Fluconazole 100 mg (up to 400 mg) PO or IV daily (AI), or  
  - Itraconazole oral solution 200 mg PO daily (AI)  
For Uncomplicated Vulvo-Vaginal Candidiasis:  
  - Oral fluconazole 150 mg for 1 dose (AI), or  
  - Topical azoles (clotrimazole, butoconazole, miconazole, tioconazole, or terconazole) for 3–7 days (AI)  
For Severe or Recurrent Vulvo-Vaginal Candidiasis:  
  - Fluconazole 100–200 mg PO daily for ≥7 days (AI), or  
  - Topical antifungal ≥7 days (AI) | For Oropharyngeal Candidiasis: Initial Episodes (For 7–14 Days):  
  Oral Therapy  
  - Itraconazole oral solution 200 mg PO daily (BI), or  
  - Posaconazole oral suspension 400 mg PO BID for 1 day, then 400 mg daily (BI)  
Topical Therapy  
  - Nystatin suspension 4–6 mL QID or 1–2 flavored pastilles 4–5 times daily (BII)  
For Esophageal Candidiasis (For 14–21 Days):  
  - Voriconazole 200 mg PO or IV BID (BI), or  
  - Anidulafungin 100 mg IV 1 time, then 50 mg IV daily (BI), or  
  - Caspofungin 50 mg IV daily (BI), or  
  - Micafungin 150 mg IV daily (BI), or  
  - Amphotericin B deoxycholate 0.6 mg/kg IV daily (BI), or  
  - Lipid formulation of amphotericin B 3–4 mg/kg IV daily (BIII)  
For Uncomplicated Vulvo-Vaginal Candidiasis:  
  - Itraconazole oral solution 200 mg PO daily for 3–7 days (BII) | Chronic or prolonged use of azoles may promote development of resistance.  
Higher relapse rate for esophageal candidiasis seen with echinocandins than with fluconazole use.  
Suppressive therapy usually not recommended (BIII) unless patients have frequent or severe recurrences.  
If Decision Is to Use Suppressive Therapy:  
  Oropharyngeal candidiasis:  
  - Fluconazole 100 mg PO daily or three times weekly (BI), or  
  - Itraconazole oral solution 200 mg PO daily (CI)  
Esophageal candidiasis:  
  - Fluconazole 100–200 mg PO daily (BI), or  
  - Posaconazole 400 mg PO BID (BII)  
Vulvo-vaginal candidiasis:  
  - Fluconazole 150 mg PO once weekly (CII) |

<td></td>
<td></td>
</tr>
</tbody>
</table>

Itraconazole, posaconazole, and voriconazole may have significant interactions with certain ARV agents. These interactions are complex and can be bi-directional. Refer to Table 5 for dosage recommendations.

Therapeutic drug monitoring and dosage adjustment may be necessary to ensure triazole antifungal and ARV efficacy and reduce concentration-related toxicities.

Random serum concentration of itraconazole + hydroitraconazole should be >1 µg/mL.

Clinical experience with voriconazole or posaconazole in the treatment of histoplasmosis is limited.

Acute pulmonary histoplasmosis in HIV-infected patients with CD4 counts >300 cells/µL should be managed as non-immunocompromised host (AIII).
### Table 2. Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy) (page 14 of 22)

<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| **Coccidioidomycosis**  | Clinically Mild Infections (e.g., Focal Pneumonia):  
• Fluconazole 400 mg* PO daily (AII), or  
• Itraconazole 200 mg* PO BID (BII)  
Bone or Joint Infections:  
• Itraconazole 200 mg* PO BID (AII)  
Severe, Non-Meningeal Infection (Diffuse Pulmonary Infection or Severely Ill Patients with Extrathoracic, Disseminated Disease):  
• Lipid formulation amphotericin B 3-5 mg/kg IV daily (AIII), or  
• Amphotericin B deoxycholate 0.7–1.0 mg/kg IV daily (AII)  
• Duration of therapy: continue until clinical improvement, then switch to a triazole (BIII)  
Meningeal Infections:  
• Fluconazole 400–800 mg* IV or PO daily (AII) | Mild Infections (Focal Pneumonia)  
For Patients Who Failed to Respond to Fluconazole or Itraconazole:  
• Posaconazole 300mg delayed-release tablet* PO BID x 1 day, then once daily (BIII), or  
• Posaconazole 400 mg oral suspension* PO BID (BII), or  
• Voriconazole 200 mg* PO BID (BIII)  
Bone or Joint Infection:  
• Fluconazole 400 mg* PO daily (BII)  
Severe, Non-Meningeal Infection (Diffuse Pulmonary Infection or Severely Ill Patients with Extrathoracic, Disseminated Disease):  
• Some specialists will add a triazole (fluconazole* or itraconazole*) 400 mg per day to amphotericin B therapy and continue triazole once amphotericin B is stopped (BIII).  
Meningeal Infections:  
• Itraconazole 200 mg* PO TID for 3 days, then 200 mg PO BID (BII), or  
• Voriconazole 200–400 mg* PO BID (BIII), or  
• Posaconazole 300 mg delayed-release tablet* PO BID x 1 day, then once daily (CIII), or  
• Posaconazole 400 mg oral suspension* PO BID (CIII), or  
• Intrathecal amphotericin B deoxycholate, when triazole antifungals are ineffective (AIII) | Relapse can occur in 25%–33% of HIV-negative patients with diffuse pulmonary or disseminated diseases. Therapy should be given for at least 12 months and usually much longer; discontinuation is dependent on clinical and serological response and should be made in consultation with experts (BIII).  
Therapy should be lifelong in patients with meningeal infections because relapse occurs in 80% of HIV-infected patients after discontinuation of triazole therapy (AII).  
* Fluconazole, itraconazole, posaconazole, and voriconazole may have significant interactions with other medications including ARV drugs. These interactions are complex and can be bi-directional. Refer to Table 5 or Antiretroviral guidelines for dosage recommendations. Therapeutic drug monitoring and dosage adjustment may be necessary to ensure triazole antifungal and antiretroviral efficacy and reduce concentration-related toxicities.  
Intrathecal amphotericin B should only be given in consultation with a specialist and administered by an individual with experience with the technique. |

</table>
| Cytomegalovirus (CMV) Disease, continued | • The optimal duration of therapy and the role of oral valganciclovir have not been established.  
• Optimize ART to achieve viral suppression and immune reconstitution (BIII). | | |
| Herpes Simplex Virus (HSV) Disease | Oropharyngeal Lesions (For 5–10 Days):  
• Valacyclovir 1 g PO BID (AIII), or  
• Famciclovir 500 mg PO BID (AIII), or  
• Acyclovir 400 mg PO TID (AIII)  
Initial or Recurrent Genital HSV (For 5–14 Days):  
• Valacyclovir 1 g PO BID (AI), or  
• Famciclovir 500 mg PO BID (AI), or  
• Acyclovir 400 mg PO TID (AI)  
Severe Mucocutaneous HSV:  
• Initial therapy acyclovir 5 mg/kg IV q8h (AIII)  
• After lesions begin to regress, change to PO therapy as above. Continue until lesions are completely healed.  
Chronic Suppressive Therapy  
For patients with severe recurrences of genital herpes (AI) or patients who want to minimize frequency of recurrences (AI):  
• Valacyclovir 500 mg PO BID (AI)  
• Famciclovir 500 mg PO BID (AI)  
• Acyclovir 400 mg PO BID (AI)  
• Continue indefinitely regardless of CD4 cell count. | For Acyclovir-Resistant HSV  
Preferred Therapy:  
• Foscarnet 80–120 mg/kg/day IV in 2–3 divided doses until clinical response (AI)  
Alternative Therapy (CIII):  
• IV cidofovir (dosage as in CMV retinitis), or  
• Topical trifluridine, or  
• Topical cidofovir, or  
• Topical imiquimod  
Duration of Therapy:  
• 21–28 days or longer | Patients with HSV infections can be treated with episodic therapy when symptomatic lesions occur, or with daily suppressive therapy to prevent recurrences.  
Topical formulations of trifluridine and cidofovir are not commercially available.  
Extemporaneous compounding of topical products can be prepared using trifluridine ophthalmic solution and the IV formulation of cidofovir. |

<tr>
<td><strong>Hepatitis B Virus (HBV) Disease</strong></td>
<td>ART regimen which includes 2 drugs that are active against both HBV and HIV is recommended for all HIV/HBV-co-infected patients regardless of CD4 cell count and HBV DNA level (AII). Tenofovir alafenamide (TAF)/ emtricitabine or tenofovir disoproxil fumerate (TDF)/emtricitabine PO once daily (+ additional drug(s) for HIV) (AIII). The choice of TAF vs. TDF should be based on renal function and risk of renal or bone toxicities.</td>
<td>If TAF or TDF Cannot Be Used as Part of HIV/HBV Therapy: Use entecavir (dose adjustment according to renal function) plus a fully suppressive ART regimen without TAF or TDF (BIIII). CrCl &lt; 30 mL/min ART with renally dose adjusted TDF and FTC can be used if recovery of renal function is unlikely (See Table 7 for dosage recommendation) If patient is not receiving ART: • HBV treatment is indicated for elevated ALT, HBV DNA &gt;2000mIU/mL, significant liver fibroses, advanced liver disease or cirrhosis (AI) • Peginterferon alfa-2a 180 µg SQ once weekly for 48 weeks (CIII), or • Peginterferon alfa 2b 1.5 µg/kg SQ once weekly for 48 weeks (CIII)</td>
<td>Chronic administration of lamivudine or emtricitabine as the only active drug against HBV should be avoided because of high rate of selection of HBV resistance (AI). Directly acting HBV drugs such as adefovir, emtricitabine, entecavir, lamivudine, telbivudine, or tenofovir must not be given in the absence of a fully suppressive ART regimen to avoid selection of drug resistance HIV (AI). When changing ART regimens, continue agents with anti-HBV activity (BI). If anti-HBV therapy is discontinued and a flare occurs, therapy should be re-instituted because it can be potentially life-saving (AI). As HBV reactivation can occur during treatment for HCV with directly active agents (DAAs) in the absence of HBV-active drugs, all HIV-HBV-coinfected patients who will be treated for HCV should be on HBV-active ART at the time of HCV treatment initiation (AII)</td>
</tr>
<tr>
<td><strong>Hepatitis C Virus (HCV) Disease</strong></td>
<td>The field of HCV drug development is evolving rapidly. The armamentarium of approved drugs is likely to expand considerably in the next few years. Clinicians should refer to the most recent HCV treatment guidelines (<a href="http://www.hcvguidelines.org">http://www.hcvguidelines.org</a>) for the most updated recommendations.</td>
<td>None.</td>

</tr>
</thead>
</table>
| Isosporiasis            | For Acute Infection:  
  • TMP-SMX (160 mg/800 mg) PO (or IV) QID for 10 days (AII), or  
  • TMP-SMX (160 mg/800 mg) PO (or IV) BID for 7–10 days (BI)  
  • Can start with BID dosing first and increase daily dose and/or duration (up to 3–4 weeks) if symptoms worsen or persist (BIII)  
  • IV therapy may be used for patients with potential or documented mal-absorption.  
Chronic Maintenance Therapy (Secondary Prophylaxis):  
  • In patients with CD4 count <200/µL, TMP-SMX (160 mg/800 mg) PO TIW (AI)  
For Acute Infection:  
  • Pyrimethamine 50–75 mg PO daily + leucovorin 10–25 mg PO daily (BIII), or  
  • Ciprofloxacin 500 mg PO BID for 7 days (CI) as a second line alternative  
Chronic Maintenance Therapy (Secondary Prophylaxis):  
  • TMP-SMX (160 mg/800 mg) PO daily or (320 mg/1600 mg) three times weekly (BIII)  
  • Pyrimethamine 25 mg PO daily + leucovorin 5–10 mg PO daily (BIII)  
  • Ciprofloxacin 500 mg three times weekly (CI) as a second-line alternative  
| Fluid and electrolyte management in patients with dehydration (AIII).  
Nutritional supplementation for malnourished patients (AIII).  
Immune reconstitution with ART may result in fewer relapses (AII). |

Key to Acronyms:  
ACTG = AIDS Clinical Trials Group; ART = antiretroviral therapy; ARV = antiretroviral; ATV/r = ritonavir-boosted atazanavir; BID = twice a day; BIW = twice weekly; BOC = boceprevir; CD4 = CD4 T lymphocyte cell; CDC = The Centers for Disease Control and Prevention; CFU = colony-forming unit; CNS = central nervous system; CSF = cerebrospinal fluid; CYP3A4 = Cytochrome P450 3A4; ddI = didanosine; DOT = directly-observed therapy; DS = double strength; EFV = efavirenz; EMB = ethambutol; g = gram; G6PD = Glucose-6-phosphate dehydrogenase; GI = gastrointestinal; ICP = intracranial pressure; ICU = intensive care unit; IM = intramuscular; IND = investigational new drug; INH = isoniazid; IRIS = immune reconstitution inflammatory syndrome; IV = intravenous; LP = lumbar puncture; mg = milligram; mmHg = millimeters of mercury; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside reverse transcriptase inhibitor; NSAID = non-steroidal anti-inflammatory drugs; PegIFN = Pegylated interferon; PI = protease inhibitor; PO = oral; PORN = Progressive Outer Retinal Necrosis; PZA = pyrazinamide; qAM = every morning; QID = four times a day; q(n)h = every “n” hours; qPM = every evening; RBV = ribavirin; RFB = rifabutin; RIF = rifampin; SQ = subcutaneous; SS = single strength; TID = three times daily; TVR = telaprevir; TMP-SMX = trimethoprim-sulfamethoxazole; ZDV = zidovudine

Key to Acronyms: ART = antiretroviral therapy; CD4 = CD4 T lymphocyte cell; CMV = cytomegalovirus; MAC = Mycobacterium avium complex; PCP = Pneumocystis pneumonia; TE = Toxoplasma encephalitis

Evidence Rating:

Strength of Recommendation:
A: Strong recommendation for the statement
B: Moderate recommendation for the statement
C: Optional recommendation for the statement

Quality of Evidence for the Recommendation:
I: One or more randomized trials with clinical outcomes and/or validated laboratory endpoints
II: One or more well-designed, nonrandomized trials or observational cohort studies with long-term clinical outcomes
III: Expert opinion

In cases where there are no data for the prevention or treatment of an OI based on studies conducted in HIV-infected populations, but data derived from HIV-uninfected patients exist that can plausibly guide management decisions for patients with HIV/AIDS, the data will be rated as III but will be assigned recommendations of A, B, C depending on the strength of recommendation.
Table 5. Significant Pharmacokinetic Interactions for Drugs Used to Treat or Prevent Opportunistic Infections

This table lists the known or suspected/predicted pharmacokinetic interactions between drugs used for the treatment or prevention of HIV-associated opportunistic infections (OIs). Many of the drugs listed in this table may also interact with antiretroviral drugs. Clinicians should refer to the drug interaction tables in the most current Guidelines for the Use of Antiretroviral Agents in HIV-1-Infected Adults and Adolescents to assess interaction potentials between OI drugs and antiretroviral therapy (ART).

Throughout the table, three recommendations are commonly used when concomitant administration of two drugs may lead to untoward consequences. The rationale for these recommendations are summarized below:

**“Do not co-administer”**
Indicates there is either strong evidence or strong likelihood that the drug-drug interaction cannot be managed with a dose modification of one or both drugs, and will/may result in either:

1. Increase in concentrations of one or both drugs, which may lead to excessive risk of toxicity; or
2. Decrease in concentrations of one or both drugs, which may render one or both drugs ineffective.

**“Co-administration should be avoided, if possible”**
There is a potential for significant pharmacokinetic interactions. However, co-administration of the drugs may be necessary if there are no other acceptable therapeutic options that provide a more favorable benefit-to-risk ratio. If other more favorable options exist, clinicians are advised to consider changing components of the regimen to accommodate a safer or more effective regimen.

**“Use with caution”**
Drug combinations are recommended to be used with caution when:

1. Pharmacokinetic studies have shown a moderate degree of interaction of unknown clinical significance; or
2. Based on the known metabolic pathway of the two drugs, there is a potential for pharmacokinetic interaction of unknown clinical significance.

**Rifamycin-Related Interactions**
Rifamycins are potent inducers of Phase I and Phase II drug metabolizing reactions. Daily doses of rifampin are well studied, and induction increases over a week or more. Based on limited data, larger doses of rifampin (e.g., 1200 mg) appear to produce the same maximum induction, but more rapidly. Single doses of rifampin may not produce significant induction. In general, rifabutin is about 40% as potent a CYP3A4 inducer as rifampin, but this can vary by substrate and enzymatic reaction. In general, daily rifapentine (for active tuberculosis [TB] disease) is at least as potent an inducer as rifampin. However, the potential of drug interactions with once weekly rifapentine (prescribed with isoniazid for latent TB infection) is not well studied, but may result in reduction of exposure of drugs that are CYP3A4 substrates. When a rifamycin is used with a potential interacting drug, close monitoring for clinical efficacy of the other agent is advised.

</table>

Key to Acronyms: 14-OH = active metabolite of clarithromycin; AUC = area under the curve; C24 = concentration at 24h post dose; Cmin = minimum concentration; Css = concentration at steady state; CYP3A4 = Cytochrome P450 3A4; des-Rbt = desacetyl rifabutin; DHA = dihydroartemisinin; EFV = efavirenz; EVG = elvitegravir; FTC = emtricitabine; HCV = hepatitis C virus; PI/c = cobicistat-boosted protease inhibitor; PI/r = ritonavir-boosted protease inhibitor; Pr/rt = ritonavir-boosted protease inhibitor; RPV = rilpivirine; T1/2 = half-life; TAF = tenofovir alafenamide; TB = tuberculosis; TDF = tenofovir disoproxil fumarate

*Rifamycins are potent inducers of Phase I and Phase II drug-metabolizing reactions. Daily doses of rifampin are well studied, and induction increases over a week or more. Based on limited data, larger doses of rifampin (for example, 1200 mg) appear to produce the same maximum induction, but more rapidly. Single doses of rifampin may not produce significant induction. In general, rifabutin is about 40% as potent a CYP3A4 inducer as rifampin, but this can vary by substrate and enzymatic reaction. In general, daily rifapentine (for active TB disease) is at least as potent an inducer as rifampin. However, the potential of drug interactions with once weekly rifapentine (for latent TB infection, along with isoniazid) is not well studied, but may result in reduction of exposure of drugs that are CYP3A4 substrates. When a rifamycin is used with a potential interacting drug, close monitoring for clinical efficacy of the other agent is advised.*
Table 6. Common or Serious Adverse Reactions Associated With Drugs Used for Preventing or Treating Opportunistic Infections (page 1 of 6) (Last updated March 13, 2017; last reviewed March 13, 2017)

<table>
<thead>
<tr>
<th>Drugs</th>
<th>Common or Serious Adverse Reactions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acyclovir</td>
<td>Crystalluria (associated with high dose, dehydration, or pre-existing renal impairment), neurotoxicity (high doses, especially in patients with renal impairment and/or older adults; agitation, confusion, hallucination, seizure, coma), nephrotoxicity secondary to obstructive urolithiasis (particularly after rapid IV infusion), thrombophlebitis at peripheral IV infusion site, nausea, vomiting, headache</td>
</tr>
<tr>
<td>Adefovir</td>
<td>Nausea, asthenia, nephrotoxicity (especially in patients with underlying renal insufficiency or predisposing comorbidities, or in patients who are currently taking nephrotoxic drugs)</td>
</tr>
<tr>
<td>Albendazole</td>
<td>Nausea, vomiting, hepatotoxicity, hypersensitivity reaction, dizziness, headache, reversible alopecia</td>
</tr>
<tr>
<td>Amikacin</td>
<td>Nephrotoxicity, ototoxicity (both hearing loss and vestibular toxicity are possible), neuromuscular blockade (associated with rapid infusion of large aminoglycoside doses), pain upon IM injection</td>
</tr>
<tr>
<td>Amoxicillin/Clavulanate and Ampicillin/Sulbactam</td>
<td>Diarrhea, nausea, vomiting, abdominal pain, Clostridium difficile-associated diarrhea and colitis, hypersensitivity reactions (immediate or delayed reactions, including anaphylaxis), bone marrow suppression, drug fever, neurotoxicity at high doses (especially in patients with renal dysfunction)</td>
</tr>
<tr>
<td>Amphotericin B Deoxycholate and Lipid Formulations</td>
<td>Nephrotoxicity, infusion-related reactions (fever, chills, rigors, back pain, hypotension), hypokalemia, hypomagnesemia, anemia, thrombophlebitis, nausea, vomiting</td>
</tr>
<tr>
<td>Anidulafungin</td>
<td>Generally well-tolerated. Hepatotoxicity, histamine-related infusion reactions (flushing, rash, pruritus, hypotension, and dyspnea are rare if infusion rate &lt;1.1 mg/min), hypokalemia, diarrhea</td>
</tr>
<tr>
<td>Artemether/Lumefantrine</td>
<td>Generally well-tolerated. Rash, pruritus, nausea, vomiting, abdominal pain, anorexia, diarrhea, arthralgia, myalgia, dizziness, asthenia, headache, hemolytic anemia (rare), QTc prolongation</td>
</tr>
<tr>
<td>Artesunate</td>
<td>Generally well-tolerated. Bradycardia, dizziness, nausea and vomiting, skin rash, pruritus, postartemisinin delayed hemolysis, QTc prolongation</td>
</tr>
<tr>
<td>Atovaquone</td>
<td>Rash, nausea, vomiting, diarrhea, hepatotoxicity, headache, hyperglycemia, fever</td>
</tr>
<tr>
<td>Atovaquone/Proguanil</td>
<td>Pruritus, rash, nausea, vomiting, abdominal pain, diarrhea, anorexia, erythema multiforme, asthenia, dizziness, headache, oral ulcers, hepatotoxicity</td>
</tr>
<tr>
<td>Azithromycin</td>
<td>Nausea, vomiting, diarrhea, hepatotoxicity, ototoxicity (with prolonged use), rash, urticaria, pruritus, abdominal pain, C. difficile-associated diarrhea, torsades de pointes (risk is greatest in patients with underlying QTc prolongation)</td>
</tr>
<tr>
<td>Aztreonam</td>
<td>Diarrhea, hypersensitivity reaction (rare), thrombophlebitis, neutropenia, increased liver enzymes, C. difficile-associated diarrhea</td>
</tr>
<tr>
<td>Benznidazole</td>
<td>Photosensitivity, allergic dermatitis, paresthesia, peripheral neuropathy, nausea, vomiting, abdominal pain, anorexia, weight loss</td>
</tr>
<tr>
<td>Bedaquiline</td>
<td>Nausea, arthralgia, headache, QTc prolongation, elevated transaminases</td>
</tr>
<tr>
<td>Capreomycin</td>
<td>Nephrotoxicity, ototoxicity (both hearing loss and vestibular toxicity are possible), pain upon IM injection</td>
</tr>
<tr>
<td>Caspofungin</td>
<td>Generally well-tolerated. Fever, thrombophlebitis, histamine-related infusion reactions (flushing, rash, pruritus, facial swelling, hypotension, dyspnea), hypokalemia, anemia, headache, hepatotoxicity, diarrhea</td>
</tr>
<tr>
<td>Ceftriaxone</td>
<td>Generally well-tolerated. Cholelithiasis, urolithiasis, pancreatitis, rash, diarrhea, drug fever, hemolytic anemia, C. difficile-associated diarrhea and colitis, injection-site reactions after IM injections, pain</td>
</tr>
<tr>
<td>Drugs</td>
<td>Common or Serious Adverse Reactions</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td><strong>Cephalosporins (for Ceftriaxone, see above)</strong></td>
<td>Hypersensitivity reaction, rash, nausea, vomiting, diarrhea, <em>C. difficile</em>-associated diarrhea and colitis, bone marrow suppression, CNS toxicities such as seizure and confusion (rare, mostly seen with high doses used in patients with renal insufficiency or elderly patients without dosage adjustment), hemolytic anemia</td>
</tr>
<tr>
<td><strong>Chloroquine and Hydroxychloroquine</strong></td>
<td>Headache, pruritus, skin pigmentation, nausea, vomiting, abdominal pain, diarrhea, anorexia, photosensitivity, visual disturbances including blurry vision and retinal toxicity, auditory disturbances, QTc prolongation, cardiomyopathy, neuromyopathy (rare, but may occur with long-term use), bone marrow suppression, hemolysis (associated with G6PD deficiency), hypersensitivity reaction (including TEN, SJS, and EM), hepatitis, neuropsychiatric changes (including extrapyramidal reactions and suicidal behavior), convulsive seizures, severe hypoglycemia (may require adjustment of antidiabetic medications)</td>
</tr>
<tr>
<td><strong>Cidofovir</strong></td>
<td>Nephrotoxicity, proteinuria, ocular hypotony, anterior uveitis/iritis, neutropenia, metabolic acidosis (including Fanconi’s syndrome), diarrhea, asthenia, fever, headache, alopecia, anemia Side effects most likely related to co-administration of probenecid: rash, nausea, vomiting, anorexia</td>
</tr>
<tr>
<td><strong>Ciprofloxacin</strong></td>
<td>Nausea, vomiting, abdominal pain, diarrhea, <em>C. difficile</em>-associated diarrhea and colitis, headache, dizziness, sleep disturbances, tendonitis and tendon rupture (associated with age &gt;60 and concomitant steroid use), photosensitivity, hypoglycemia, hepatotoxicity, QTc prolongation, neurotoxicity (especially with high doses, use in elderly patients, or use in patients with renal dysfunction), seizures, peripheral neuropathy</td>
</tr>
<tr>
<td><strong>Clarithromycin</strong></td>
<td>Hepatotoxicity, ototoxicity (with high doses or prolonged use), headache, nausea, vomiting, abdominal cramps, diarrhea, <em>C. difficile</em>-associated diarrhea and colitis, rash, QTc prolongation, dysgeusia</td>
</tr>
<tr>
<td><strong>Clindamycin</strong></td>
<td>Nausea, vomiting, abdominal pain, diarrhea, <em>C. difficile</em>-associated diarrhea and colitis, rash, arrhythmia associated with rapid IV infusion, metallic taste (with IV infusion), thrombophlebitis, abnormal liver function tests</td>
</tr>
<tr>
<td><strong>Clotrimazole (Troche)</strong></td>
<td>Generally well-tolerated. Nausea, vomiting, anorexia, metallic taste, increase in serum transaminases (rare)</td>
</tr>
<tr>
<td><strong>Cycloserine</strong></td>
<td>Neuropsychiatric toxicities (headache, somnolence, lethargy, vertigo, tremor, dysarthria, irritability, confusion, paranoia, psychosis), seizures (particularly in patients with history of chronic alcoholism), allergic dermatitis, rash, elevated transaminases, congestive heart failure (in patients receiving cycloserine 1-1.5 g daily)</td>
</tr>
<tr>
<td><strong>Dapsone</strong></td>
<td>Methemoglobinemia, hemolytic anemia (especially in patients with G6PD deficiency), neutropenia, dermatologic reactions (including rash), sulfone syndrome (fever, exfoliative dermatitis, lymphadenopathy, hepatic necrosis, hemolysis), peripheral neuropathy, hepatotoxicity, drug-induced lupus erythematosus, nephrotic syndrome, phototoxicity</td>
</tr>
<tr>
<td><strong>Daclatasvir</strong></td>
<td>Fatigue, headache, nausea, anemia, bradycardia (when co-administered with sofosbuvir and amiodarone)</td>
</tr>
<tr>
<td><strong>Dasabuvir, Ombitasvir, Paritaprevir, and Ritonavir</strong></td>
<td>Hepatotoxicity, nausea, pruritus, rash, insomnia, fatigue, asthenia, dyspnea (associated with ribavirin co-administration)</td>
</tr>
<tr>
<td><strong>Doxycycline</strong></td>
<td>Photosensitivity reaction, nausea, vomiting, diarrhea, esophageal ulceration, thrombophlebitis (with IV infusion), hepatotoxicity (rare), intracranial hypertension, <em>C. difficile</em>-associated diarrhea and colitis, tissue hyperplasia</td>
</tr>
<tr>
<td><strong>Elbasvir/Grazoprevir</strong></td>
<td>Fatigue, headache, nausea, ALT elevations, anemia (when given with ribavirin)</td>
</tr>
<tr>
<td><strong>Emtricitabine</strong></td>
<td>Generally well-tolerated. Headache, nausea, skin hyperpigmentation, diarrhea, rash</td>
</tr>
<tr>
<td><strong>Entecavir</strong></td>
<td>Generally well-tolerated. Headache, fatigue, dizziness, nausea</td>
</tr>
<tr>
<td><strong>Erythromycin</strong></td>
<td>Nausea, vomiting, abdominal pain, anorexia, rash, hepatotoxicity, cholestatic jaundice, ototoxicity (hearing loss, tinnitus), rash, QTc prolongation and cardiac arrhythmia, <em>C. difficile</em>-associated diarrhea and colitis, thrombophlebitis (with IV infusion)</td>
</tr>

</thead>
<tbody>
<tr>
<td><strong>Meropenem</strong></td>
<td>Generally well-tolerated. Hypersensitivity reaction (immediate or delayed), nausea, vomiting, diarrhea, <em>C. difficile</em>-associated diarrhea and colitis, thrombophlebitis, headache, bone marrow suppression, drug fever.</td>
</tr>
<tr>
<td><strong>Micafungin</strong></td>
<td>Generally well-tolerated. Histamine-related infusion reactions (such as flushing, rash, pruritus, hypotension, dyspnea) may occur, but these are rare if infusion lasts over 1 hour; anaphylaxis and anaphylactoid reaction, hepatotoxicity, thrombophlebitis, nausea, vomiting, diarrhea, hypokalemia, hemolysis (rare)</td>
</tr>
<tr>
<td><strong>Miconazole Buccal Tablets</strong></td>
<td>Dysgeusia, diarrhea, nausea, vomiting, upper abdominal pain, headache, local reactions (oral discomfort, burning, pain, tongue/mouth ulceration, gingival pruritus, swelling, dry mouth), hypersensitivity reaction (rare—may occur in patients with known hypersensitivity reaction to milk product concentrate)</td>
</tr>
<tr>
<td><strong>Miltexosine</strong></td>
<td>Nausea, vomiting, diarrhea, headache, motion sickness, leukocytosis, thrombocytosis, nephrotoxicity, retinal degeneration, elevated transaminases and bilirubin, teratogenic potential, impaired fertility</td>
</tr>
<tr>
<td><strong>Moxifloxacin</strong></td>
<td>Nausea, vomiting, abdominal pain, diarrhea, <em>C. difficile</em>-associated diarrhea and colitis, headache, dizziness, sleep disturbances, tendonitis and tendon rupture (associated with &gt;60 years of age and concomitant steroid use), photosensitivity, hypoglycemia, hepatotoxicity, QTc prolongation, neurotoxicity (especially with high doses, use in elderly patients, or use in patients with renal dysfunction), seizures (rare), peripheral neuropathy</td>
</tr>
<tr>
<td><strong>Nifurtimox</strong></td>
<td>Anorexia, weight loss, nausea, vomiting, abdominal pain, headache, dizziness, mood changes, insomnia, myalgia, peripheral neuropathy, rash, pruritus, memory loss</td>
</tr>
<tr>
<td><strong>Nitazoxanide</strong></td>
<td>Generally well-tolerated. Nausea, vomiting, diarrhea, abdominal pain, headache</td>
</tr>
<tr>
<td><strong>Nystatin (Oral Preparations)</strong></td>
<td>Unpleasant taste, nausea, vomiting, anorexia, diarrhea, hypersensitivity reaction (rare)</td>
</tr>
<tr>
<td><strong>Penicillin G</strong></td>
<td>All Penicillin G Preparations: Hypersensitivity reactions (immediate or delayed reactions, including anaphylaxis), bone marrow suppression, nausea, vomiting, diarrhea, <em>C. difficile</em>-associated diarrhea and colitis, drug fever.</td>
</tr>
<tr>
<td></td>
<td>Benzathine Penicillin G and Procaine Penicillin G: IM injection-site reactions (pain and erythema), procaine neuropsychiatric reactions (high dose), neurovascular damage (as a result of inadvertent intravascular instead of IM injection)</td>
</tr>
<tr>
<td></td>
<td>Aqueous Crystalline Penicillin G (IV): Thrombophlebitis, neurotoxicity at high doses (especially in patients with renal dysfunction)</td>
</tr>
<tr>
<td><strong>Pentamidine</strong></td>
<td>IV Infusion: Nephrotoxicity, infusion-related hypotension, thrombophlebitis, QTc prolongation, arrhythmias (including torsades de pointes), pancreatitis, hypoglycemia, hyperglycemia, diabetes mellitus, hepatotoxicity, electrolyte abnormalities, leucopenia, thrombocytopenia</td>
</tr>
<tr>
<td></td>
<td>Aerosolized Therapy: Bronchospasm, cough, dyspnea, tachypnea, metallic taste, pancreatitis (rare)</td>
</tr>
<tr>
<td><strong>Pentavalent Antimony (Sodium Stibogluconate)</strong></td>
<td>Nausea, vomiting, abdominal pain, anorexia, pancreatitis (rare), headache, hepatotoxicity, arthralgia, myalgia, cardiac toxicity with higher than 20 mg/kg dose, rash, thrombophlebitis, leukopenia, anemia, thrombocytopenia</td>
</tr>
<tr>
<td><strong>Posaconazole</strong></td>
<td>Nausea, vomiting, diarrhea, abdominal pain, headache, hepatotoxicity, hypokalemia, QTc prolongation, rash</td>
</tr>
<tr>
<td></td>
<td>IV Infusion: Thrombophlebitis, cyclodextrin accumulation (especially in patients with eGFR &lt;50 mL/min, which may lead to renal toxicities)</td>
</tr>
<tr>
<td><strong>Piperacillin-Tazobactam</strong></td>
<td>Generally well-tolerated. Hypersensitivity reaction, rash, diarrhea, nausea, vomiting, <em>C. difficile</em>-associated diarrhea and colitis, thrombophlebitis, thrombocytopenia (rare), impaired platelet aggregation, seizure (with high doses used in patients with renal insufficiency)</td>
</tr>
<tr>
<td><strong>Primaquine</strong></td>
<td>Methemoglobinemia, hemolytic anemia (especially in patients with G6PD deficiency), leukopenia, neutropenia, abdominal cramps, nausea, vomiting, QTc prolongation, pruritus, rash, dizziness</td>
</tr>

(continued)

<table>
<thead>
<tr>
<th>Drug</th>
<th>FDA Category</th>
<th>Pertinent Animal Reproductive and Human Pregnancy Data</th>
<th>Recommended Use During Pregnancy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acyclovir</td>
<td>B</td>
<td>No teratogenicity in mice, rats, rabbits at human levels. Large experience in pregnancy (&gt;700 first-trimester exposures reported to registry); well-tolerated.</td>
<td>Treatment of frequent or severe symptomatic herpes outbreaks or varicella</td>
</tr>
<tr>
<td>Adefovir</td>
<td>C</td>
<td>No increase in malformations at 23 times (rats) and 40 times (rabbits) human dose. Limited experience with human use in pregnancy.</td>
<td>Not recommended because of limited data in pregnancy. Report exposures during pregnancy to Antiretroviral Pregnancy Registry: <a href="http://www.APRegistry.com">http://www.APRegistry.com</a></td>
</tr>
<tr>
<td>Albendazole</td>
<td>C</td>
<td>Embryotoxic and teratogenic (skeletal malformations) in rats and rabbits, but not in mice or cows. Limited experience in human pregnancy.</td>
<td>Not recommended, especially in first trimester. Primary therapy for microsporidiosis in pregnancy should be ART.</td>
</tr>
<tr>
<td>Amikacin</td>
<td>C</td>
<td>Not teratogenic in mice, rats, rabbits. Theoretical risk of ototoxicity in fetus; reported with streptomycin but not amikacin.</td>
<td>Drug-resistant TB, severe MAC infections</td>
</tr>
<tr>
<td>Amoxicillin, amox./clavulanate, ampicillin/sulbactam</td>
<td>B</td>
<td>Not teratogenic in animals. Large experience in human pregnancy does not suggest an increase in adverse events.</td>
<td>Susceptible bacterial infections</td>
</tr>
<tr>
<td>Amphotericin B</td>
<td>B</td>
<td>Not teratogenic in animals or in human experience. Preferred over azole antifungals in first trimester if similar efficacy expected.</td>
<td>Documented invasive fungal disease</td>
</tr>
<tr>
<td>Antimonials, pentavalent (stibogluconate, meglumine)</td>
<td>Not FDA approved</td>
<td>Antimony not teratogenic in rats, chicks, sheep. Three cases reported of use in human pregnancy in second trimester with good outcome. Labeled as contraindicated in pregnancy.</td>
<td>Therapy of visceral leishmaniasis not responsive to amphotericin B or pentamidine</td>
</tr>
<tr>
<td>Artesunate, artemether, artemether/ lumefantrine</td>
<td>C</td>
<td>Embryotoxicity, cardiovascular and skeletal anomalies in rats and rabbits. Embryotoxic in monkeys. Human experience, primarily in the second and third trimesters, has not identified increased adverse events.</td>
<td>Recommended by WHO as first-line therapy in second/third trimester for <em>P. falciparum</em> and severe malaria. Pending more data, use for malaria in first trimester only if other drugs not available or have failed. Report cases of exposure to WHO Anti-malarial Pregnancy Exposure Registry when available.</td>
</tr>
<tr>
<td>Atovaquone</td>
<td>C</td>
<td>Not teratogenic in rats or rabbits, limited human experience</td>
<td>Alternate agent for PCP, <em>Toxoplasma gondii</em>, malaria infections</td>
</tr>
<tr>
<td>Azithromycin</td>
<td>B</td>
<td>Not teratogenic in animals. Moderate experience with use in human pregnancy does not suggest adverse events.</td>
<td>Preferred agent for MAC prophylaxis or treatment (with ethambutol), <em>Chlamydia trachomatis</em> infection in pregnancy.</td>
</tr>
<tr>
<td>Aztreonam</td>
<td>B</td>
<td>Not teratogenic in rats, rabbits. Limited human experience, but other beta-lactam antibiotics have not been associated with adverse pregnancy outcomes.</td>
<td>Susceptible bacterial infections</td>
</tr>
<tr>
<td>Bedaquiline</td>
<td>B</td>
<td>Not teratogenic in rats, rabbits. No experience in human pregnancy.</td>
<td>Multidrug resistant TB when effective treatment regimen can not otherwise be provided.</td>
</tr>
</tbody>
</table>

<td>Embryotoxic, skeletal defects in rats, rabbits. No experience with human use.</td>
<td>Invasive <em>Candida</em> or <em>Aspergillus</em> infections refractory to amphotericin and azoles</td>
</tr>
<tr>
<td>Cephalosporins</td>
<td>B</td>
<td>Not teratogenic in animals. Large experience in human pregnancy has not suggested increase in adverse outcomes.</td>
<td>Bacterial infections; alternate treatment for MAC</td>
</tr>
<tr>
<td>Chloroquine</td>
<td>C</td>
<td>Associated with anophthalmia, microophthalmia at tetotoxic doses in animals. Not associated with increased risk in human pregnancy at doses used for malaria.</td>
<td>Drug of choice for malaria prophylaxis and treatment of sensitive species in pregnancy.</td>
</tr>
<tr>
<td>Cidofovir</td>
<td>C</td>
<td>Embryotoxic and teratogenic (meningocele, skeletal abnormalities) in rats and rabbits. No experience in human pregnancy.</td>
<td>Not recommended</td>
</tr>
<tr>
<td>Ciprofloxacin, other quinolones</td>
<td>C</td>
<td>Arthropathy in immature animals; not embryotoxic or teratogenic in mice, rats, rabbits, or monkeys. More than 1100 cases of quinolone use in human pregnancy have not been associated with arthropathy or birth defects.</td>
<td>Severe MAC infections; multidrug resistant TB, anthrax, bacterial infections</td>
</tr>
<tr>
<td>Clarithromycin</td>
<td>C</td>
<td>Cardiovascular defects noted in one strain of rats and cleft palate in mice at high doses, not teratogenic in rabbits or monkeys. Two human studies, each with &gt;100 first-trimester exposures, did not show increase in defects but one study found an increase in spontaneous abortion.</td>
<td>Treatment or secondary MAC prophylaxis, if other choices exhausted</td>
</tr>
<tr>
<td>Clindamycin</td>
<td>B</td>
<td>No concerns specific to pregnancy in animal or human studies.</td>
<td>Treatment of anaerobic bacterial infections and used with quinine for chloroquineresistant malaria; alternate agent for secondary prophylaxis of <em>Toxoplasma</em> encephalitis</td>
</tr>
<tr>
<td>Clofazimine</td>
<td>C</td>
<td>Not teratogenic in mice, rats, or rabbits. Limited experience reported (19 cases); no anomalies noted but red-brown skin discoloration reported in several infants exposed throughout pregnancy.</td>
<td>No indications.</td>
</tr>
<tr>
<td>Clotrimazole troches</td>
<td>C</td>
<td>Not teratogenic in animals at exposures expected from treatment of oral or vaginal <em>Candida</em>. No increase in adverse pregnancy outcomes with vaginal use.</td>
<td>Oral or vaginal <em>Candida</em> infections and prophylaxis</td>
</tr>
<tr>
<td>Cycloserine</td>
<td>C</td>
<td>Not teratogenic in rats. No data available from human studies.</td>
<td>Drug-resistant TB</td>
</tr>
</tbody>
</table>
### Table 8. Summary of Pre-Clinical and Human Data on, and Indications for, Opportunistic Infection Drugs During Pregnancy (page 3 of 9)

| Drug                        | FDA Category | Pertinent Animal Reproductive and Human Pregnancy Data                                                                                                                                                                                                 | Recommended Use During Pregnancy                                                                 |
|-----------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dapsone                     | C            | No animal data. Limited human experience does not suggest teratogenicity; might displace bound bilirubin in the neonate, increasing the risk of kernicterus. Case reports of hemolytic anemia in fetus/infant with maternal treatment.                                       | Alternate choice for primary or secondary PCP prophylaxis                                          |
| Diphenoxylate               | C            | Limited animal and human data do not indicate teratogenicity.                                                                                                                                                                                                                                               | Symptomatic treatment of diarrhea                                                               |
| Doxycycline, other tetracyclines | D           | Risk of hepatic toxicity increased with tetracyclines in pregnancy; staining of fetal bones and teeth contraindicates use in pregnancy.                                                                                                                                                                    | No indications                                                                                |
| Emtricitabine               | B            | No concerns in pregnancy from limited animal and human data.                                                                                                                                                                                                                                               | As part of fully suppressive combination antiretroviral regimen for treatment of HIV, HBV. Report exposures during pregnancy to Antiretroviral Pregnancy Registry: [http://www.APRegistry.com](http://www.APRegistry.com) |
| Entecavir                   | C            | Animal data do not suggest teratogenicity at human doses; limited experience in human pregnancy.                                                                                                                                                                                                            | Not recommended because of limited data in pregnancy. Use as part of fully suppressive ARV regimen with ARV agents active against both HIV and HBV. Report exposures during pregnancy to Antiretroviral Pregnancy Registry: [http://www.APRegistry.com](http://www.APRegistry.com) |
| Erythromycin                | B            | Hepatotoxicity with erythromycin estolate in pregnancy; other forms acceptable; no evidence of teratogenicity                                                                                                                                                                                               | Bacterial and chlamydial infections                                                               |
| Ethambutol                  | B            | Teratogenic, at high doses, in mice, rats, rabbits. No evidence of teratogenicity in 320 cases of human use for treatment of TB.                                                                                                                                                                               | Active TB and MAC treatment; avoid in first trimester if possible                                |
| Ethionamide                 | C            | Increased rate of defects (omphalocele, exencephaly, cleft palate) in rats, mice, and rabbits with high doses; not seen with usual human doses. Limited human data; case reports of CNS defects.                                                                                                                   | Active TB; avoid in first trimester if possible                                                    |
| Famciclovir                 | B            | No evidence of teratogenicity in rats or rabbits, limited human experience.                                                                                                                                                                                                                                   | Recurrent genital herpes and primary varicella infection. Report exposures during pregnancy to the Famvir Pregnancy Registry (1-888-669-6682).                                      |
| Fluconazole                 | C            | Abnormal ossification, structural defects in rats, mice at high doses. Case reports of rare pattern of craniofacial, skeletal and other abnormalities in five infants born to four women with prolonged exposure during pregnancy; no increase in defects seen in several series after single dose treatment. | Single dose may be used for treatment of vaginal Candida though topical therapy preferred. Not recommended for prophylaxis during early pregnancy. Can be used for invasive fungal infections after first trimester; amphotericin B preferred in first trimester if similar efficacy expected. |
### Table 8. Summary of Pre-Clinical and Human Data on, and Indications for, Opportunistic Infection Drugs During Pregnancy (page 4 of 9)

<table>
<thead>
<tr>
<th>Drug</th>
<th>FDA Category</th>
<th>Pertinent Animal Reproductive and Human Pregnancy Data</th>
<th>Recommended Use During Pregnancy</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Flucytosine</strong></td>
<td>C</td>
<td>Facial clefts and skeletal defects in rats; cleft palate in mice, no defects in rabbits. No reports of use in first trimester of human pregnancy; may be metabolized to 5-fluorouracil, which is teratogenic in animals and possibly in humans.</td>
<td>Use after first trimester if indicated for life-threatening fungal infections.</td>
</tr>
<tr>
<td><strong>Foscarnet</strong></td>
<td>C</td>
<td>Skeletal variants in rats, rabbits and hypoplastic dental enamel in rats. Single case report of use in human pregnancy in third trimester.</td>
<td>Alternate agent for treatment or secondary prophylaxis of life-threatening or sight-threatening CMV infection.</td>
</tr>
<tr>
<td><strong>Fumagillin</strong></td>
<td>Not FDA approved</td>
<td>Caused complete litter destruction or growth retardation in rats, depending on when administered. No data in human pregnancy.</td>
<td>Topical solution can be used for ocular microsporidial infections.</td>
</tr>
<tr>
<td><strong>Ganciclovir, valganciclovir</strong></td>
<td>C</td>
<td>Embryotoxic in rabbits and mice; teratogenic in rabbits (cleft palate, anophthalmia, aplastic kidney and pancreas, hydrocephalus). Case reports of safe use in human pregnancy after transplants, treatment of fetal CMV.</td>
<td>Treatment or secondary prophylaxis of life-threatening or sight-threatening CMV infection. Preferred agent for therapy in children.</td>
</tr>
<tr>
<td><strong>Imipenem, meropenem</strong></td>
<td>C/B</td>
<td>Not teratogenic in animals; limited human experience.</td>
<td>Serious bacterial infections</td>
</tr>
<tr>
<td><strong>Imiquimod</strong></td>
<td>B</td>
<td>Not teratogenic in rats and rabbits; 8 case reports of human use, only 2 in first trimester.</td>
<td>Because of limited experience, other treatment modalities such as cryotherapy or trichloracetic acid recommended for wart treatment during pregnancy.</td>
</tr>
<tr>
<td><strong>Influenza vaccine</strong></td>
<td>C</td>
<td>Not teratogenic. Live vaccines, including intranasal influenza vaccine, are contraindicated in pregnancy.</td>
<td>All pregnant women should receive injectable influenza vaccine because of the increased risk of complications of influenza during pregnancy. Ideally, HIV-infected women should be on ART before vaccination to limit potential increases in HIV RNA levels with immunization.</td>
</tr>
<tr>
<td><strong>Interferons (alfa, beta, gamma)</strong></td>
<td>C</td>
<td>Abortifacient at high doses in monkeys, mice; not teratogenic in monkeys, mice, rats, or rabbits. Approximately 30 cases of use of interferon-alfa in pregnancy reported; 14 in first trimester without increase in anomalies; possible increased risk of intrauterine growth retardation.</td>
<td>Not indicated. Treatment of HCV currently generally not recommended in pregnancy.</td>
</tr>
<tr>
<td><strong>Isoniazid</strong></td>
<td>C</td>
<td>Not teratogenic in animals. Possible increased risk of hepatotoxicity during pregnancy; prophylactic pyridoxine, 50 mg/day, should be given to prevent maternal and fetal neurotoxicity.</td>
<td>Active TB; prophylaxis for exposure or skin test conversion.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Drug</th>
<th>FDA Category</th>
<th>Pertinent Animal Reproductive and Human Pregnancy Data</th>
<th>Recommended Use During Pregnancy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Itraconazole</td>
<td>C</td>
<td>Teratogenic in rats and mice at high doses. Case reports of craniofacial, skeletal abnormalities in humans with prolonged fluconazole exposure during pregnancy; no increase in defect rate noted among over 300 infants born after first-trimester itraconazole exposure.</td>
<td>Only for documented systemic fungal disease, not prophylaxis. Consider using amphotericin B in first trimester if similar efficacy expected.</td>
</tr>
<tr>
<td>Kanamycin</td>
<td>D</td>
<td>Associated with club feet in mice, inner ear changes in multiple species. Hearing loss in 2.3% of 391 children after long-term in utero therapy.</td>
<td>Drug-resistant TB</td>
</tr>
<tr>
<td>Ketoconazole</td>
<td>C</td>
<td>Teratogenic in rats, increased fetal death in mice, rabbits. Inhibits androgen and corticosteroid synthesis; may impact fetal male genital development; case reports of craniofacial, skeletal abnormalities in humans with prolonged fluconazole exposure during pregnancy.</td>
<td>None</td>
</tr>
<tr>
<td>Lamivudine</td>
<td>C</td>
<td>Not teratogenic in animals. No evidence of teratogenicity with &gt;3700 first-trimester exposures reported to Antiretroviral Pregnancy Registry.</td>
<td>HIV and HBV therapy, only as part of a fully suppressive combination ARV regimen. Report exposures to Antiretroviral Pregnancy Registry: <a href="http://www.APRegistry.com">http://www.APRegistry.com</a>.</td>
</tr>
<tr>
<td>Leucovorin (folic acid)</td>
<td>C</td>
<td>Prevents birth defects of valproic acid, methotrexate, phenytoin, aminopterin in animal models. No evidence of harm in human pregnancies.</td>
<td>Use with pyrimethamine if use of pyrimethamine cannot be avoided.</td>
</tr>
<tr>
<td>Linezolid</td>
<td>C</td>
<td>Not teratogenic in animals. Decreased fetal weight and neonatal survival at ~ human exposures, possibly related to maternal toxicity. Limited human experience.</td>
<td>Serious bacterial infections</td>
</tr>
<tr>
<td>Loperamide</td>
<td>B</td>
<td>Not teratogenic in animals. No increase in birth defects among infants born to 89 women with first-trimester exposure in one study; another study suggests a possible increased risk of hypospadias with first-trimester exposure, but confirmation required.</td>
<td>Symptomatic treatment of diarrhea after the first trimester</td>
</tr>
<tr>
<td>Mefloquine</td>
<td>C</td>
<td>Animal data and human data do not suggest an increased risk of birth defects, but miscarriage and stillbirth may be increased.</td>
<td>Second-line therapy of chloroquine-resistant malaria in pregnancy, if quinine/clindamycin not available or not tolerated. Weekly as prophylaxis in areas with chloroquine-resistant malaria.</td>
</tr>
<tr>
<td>Meglumine</td>
<td>Not FDA approved</td>
<td>See Antimonials, pentavalent</td>
<td></td>
</tr>
<tr>
<td>Metronidazole</td>
<td>B</td>
<td>Multiple studies do not indicate teratogenicity. Studies on several hundred women with first-trimester exposure found no increase in birth defects.</td>
<td>Anaerobic bacterial infections, bacterial vaginosis, trichomoniasis, giardiasis, amebiasis</td>
</tr>
<tr>
<td>Micafungin</td>
<td>C</td>
<td>Teratogenic in rabbits; no human experience.</td>
<td>Not recommended</td>
</tr>
</tbody>
</table>

<tbody>
<tr>
<td>Miltefosine</td>
<td>Not FDA approved</td>
<td>Embryotoxic in rats, rabbits; teratogenic in rats. No experience with human use.</td>
<td>Not recommended</td>
</tr>
<tr>
<td>Nifurtimox</td>
<td>Not FDA approved</td>
<td>Not teratogenic in mice and rats. Increased chromosomal aberrations in children receiving treatment; uncertain significance. No experience in human pregnancy.</td>
<td>Not indicated in chronic infection; seek expert consultation if acute infection or symptomatic reactivation of <em>T. cruzi</em> in pregnancy.</td>
</tr>
<tr>
<td>Nitazoxanide</td>
<td>B</td>
<td>Not teratogenic in animals; no human data</td>
<td>Severely symptomatic cryptosporidiosis after the first trimester</td>
</tr>
<tr>
<td>Para-amino salicylic acid (PAS)</td>
<td>C</td>
<td>Occipital bone defects in one study in rats; not teratogenic in rabbits. Possible increase in limb, ear anomalies in one study with 143 first-trimester exposures; no specific pattern of defects noted, several studies did not find increased risk.</td>
<td>Drug-resistant TB</td>
</tr>
<tr>
<td>Paromomycin</td>
<td>C</td>
<td>Not teratogenic in mice and rabbits. Limited human experience, but poor oral absorption makes toxicity, teratogenicity unlikely.</td>
<td>Amebic intestinal infections, possibly cryptosporidiosis</td>
</tr>
<tr>
<td>Penicillin</td>
<td>B</td>
<td>Not teratogenic in multiple animal species. Vast experience with use in human pregnancy does not suggest teratogenicity, other adverse outcomes.</td>
<td>Syphilis, other susceptible bacterial infections</td>
</tr>
<tr>
<td>Pentamidine</td>
<td>C</td>
<td>Embryocidal but not teratogenic in rats, rabbits with systemic use. Limited experience with systemic use in pregnancy.</td>
<td>Alternate therapy for PCP and leishmaniasis</td>
</tr>
<tr>
<td>Piperacillin-tazobactam</td>
<td>B</td>
<td>Not teratogenic in limited animal studies. Limited experience in pregnancy but penicillins generally considered safe.</td>
<td>Bacterial infections</td>
</tr>
<tr>
<td>Pneumococcal vaccine</td>
<td>C</td>
<td>No studies in animal pregnancy. Polysaccharide vaccines generally considered safe in pregnancy. Well-tolerated in third-trimester studies.</td>
<td>Initial or booster dose for prevention of invasive pneumococcal infections. HIV-infected pregnant women should be on ART before vaccination to limit potential increases in HIV RNA levels with immunization.</td>
</tr>
<tr>
<td>Podophyllin, podofilox</td>
<td>C</td>
<td>Increased embryonic and fetal deaths in rats, mice but not teratogenic. Case reports of maternal, fetal deaths after use of podophyllin resin in pregnancy; no clear increase in birth defects with first-trimester exposure.</td>
<td>Because alternative treatments for genital warts in pregnancy are available, use not recommended; inadvertent use in early pregnancy is not indication for abortion.</td>
</tr>
<tr>
<td>Posaconazole</td>
<td>C</td>
<td>Embryotoxic in rabbits; teratogenic in rats at similar to human exposures. No experience in human pregnancy.</td>
<td>Not recommended</td>
</tr>
<tr>
<td>Prednisone</td>
<td>B</td>
<td>Dose-dependent increased risk of cleft palate in mice, rabbits, hamsters; dose-dependent increase in genital anomalies in mice. Human data inconsistent regarding increased risk of cleft palate. Risk of growth retardation, low birth weight may be increased with chronic use; monitor for hyperglycemia with use in third trimester.</td>
<td>Adjunctive therapy for severe PCP; multiple other non-HIV-related indications</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td>Primaquine</td>
<td>C</td>
<td>No animal data. Limited experience with use in human pregnancy; theoretical risk for hemolytic anemia if fetus has G6PD deficiency.</td>
<td>Alternate therapy for PCP, chloroquine-resistant malaria</td>
</tr>
<tr>
<td>Proguanil</td>
<td>C</td>
<td>Not teratogenic in animals. Widely used in malaria-endemic areas with no clear increase in adverse outcomes.</td>
<td>Alternate therapy and prophylaxis of P. falciparum malaria</td>
</tr>
<tr>
<td>Pyrazinamide</td>
<td>C</td>
<td>Not teratogenic in rats, mice. Limited experience with use in human pregnancy.</td>
<td>Active TB</td>
</tr>
<tr>
<td>Pyrimethamine</td>
<td>C</td>
<td>Teratogenic in mice, rats, hamsters (cleft palate, neural tube defects, and limb anomalies). Limited human data have not suggested an increased risk of birth defects; because folate antagonist, use with leucovorin.</td>
<td>Treatment and secondary prophylaxis of toxoplastic encephalitis; alternate treatment of PCP</td>
</tr>
<tr>
<td>Quinidine gluconate</td>
<td>C</td>
<td>Generally considered safe in pregnancy; high doses associated with preterm labor. One case of fetal 8th nerve damage reported.</td>
<td>Alternate treatment of malaria, control of fetal arrhythmias</td>
</tr>
<tr>
<td>Quinine sulfate</td>
<td>C</td>
<td>High doses, often taken as an abortifacient, have been associated with birth defects, especially deafness, in humans and animals. Therapeutic doses have not been associated with an increased risk of defects in humans or animals. Monitor for hypoglycemia.</td>
<td>Treatment of chloroquine-resistant malaria</td>
</tr>
<tr>
<td>Ribavirin</td>
<td>X</td>
<td>Dose-dependent risk of multiple defects (craniofacial, central nervous system, skeletal, anophthalmia) in rats, mice, hamsters starting at below human doses. Reports of treatment during second half of pregnancy in nine women without incident; first 49 cases in registry did not suggest increased risk, but limited data.</td>
<td>Contraindicated in early pregnancy; no clear indications in pregnancy. Report exposures during pregnancy to Ribavirin Pregnancy Registry at (800) 593-2214 or <a href="http://www.ribavirinpregnancyregistry.com">www.ribavirinpregnancyregistry.com</a></td>
</tr>
<tr>
<td>Rifabutin</td>
<td>B</td>
<td>Not teratogenic in rats and rabbits; no specific concerns for human pregnancy.</td>
<td>Treatment or prophylaxis of MAC, active TB</td>
</tr>
<tr>
<td>Rifampin</td>
<td>C</td>
<td>Teratogenic at high doses in mice (cleft palate) and rats (spina bifida) but not in rabbits. No clear teratogenicity in humans.</td>
<td>Active TB</td>
</tr>
<tr>
<td>Simeprevir</td>
<td>C</td>
<td>Decreased fetal weights and increased skeletal variants in mice at 4x human exposure. Increased deaths and decreased fetal and neonatal growth and developmental delay after in utero exposure in rats. No experience in human pregnancy.</td>
<td>Treatment of HCV currently generally not recommended in pregnancy.</td>
</tr>
<tr>
<td>Sinecatechin ointment</td>
<td>C</td>
<td>No evidence of teratogenicity in rats and rabbits after oral or intravaginal dosing. No experience in human pregnancy.</td>
<td>Not recommended based on lack of data.</td>
</tr>
<tr>
<td>Sofobusvir</td>
<td>B</td>
<td>No evidence of teratogenicity in rats or rabbits. No experience in human pregnancy.</td>
<td>Treatment of HCV generally not indicated in pregnancy. Regimens including ribavirin and interferon are contraindicated in pregnancy.</td>
</tr>

</tr>
<tr>
<td>Streptomycin</td>
<td>D</td>
<td>No teratogenicity in mice, rats, guinea pigs. Possible increased risk of deafness and VIII nerve damage; no evidence of other defects.</td>
<td>Alternate therapy for active TB</td>
</tr>
<tr>
<td>Sulfadiazine</td>
<td>B</td>
<td>Sulfonamides teratogenic in some animal studies. No clear teratogenicity in humans; potential for increased jaundice, kernicterus if used near delivery.</td>
<td>Secondary prophylaxis of toxoplastic encephalitis</td>
</tr>
<tr>
<td>Telaprevir</td>
<td>B</td>
<td>Not teratogenic in mice, rats. No human pregnancy data.</td>
<td>Treatment of HCV currently generally not indicated in pregnancy.</td>
</tr>
<tr>
<td>Tenofovir</td>
<td>B</td>
<td>No evidence of birth defects in rats, rabbits, or monkeys at high doses; chronic administration in immature animals of multiple species at 6–50 times human doses has led to dose-specific bone changes ranging from decreased mineral density to severe osteomalacia and fractures. Clinical studies in humans (particularly children) show bone demineralization with chronic use; clinical significance unknown. No evidence of increased birth defects in nearly 2000 first-trimester exposures in women.</td>
<td>Component of fully suppressive antiretroviral regimen in pregnant women. Report exposures during pregnancy to Antiretroviral Pregnancy Registry: <a href="http://www.APRegistry.com">http://www.APRegistry.com</a>.</td>
</tr>
<tr>
<td>Trichloracetic acid, bichloracetic acid</td>
<td>Not rated</td>
<td>No studies. Used topically so no systemic absorption expected.</td>
<td>Topical therapy of non-cervical genital warts</td>
</tr>
<tr>
<td>Trifluridine</td>
<td>C</td>
<td>Not teratogenic in rats, rabbits. Minimal systemic absorption expected with topical ocular use.</td>
<td>Topical agent for treatment of ocular herpes infections</td>
</tr>
<tr>
<td>Trimethoprim-sulfamethoxazole</td>
<td>C</td>
<td>Teratogenic in rats and mice. Possible increase in congenital cardiac defects, facial clefts, neural tube and urinary defects with first-trimester use. Unclear if higher levels of folate supplementation lower risk. Theoretical risk of elevated bilirubin in the neonate if used near delivery.</td>
<td>Therapy of PCP during pregnancy. Primary and secondary PCP prophylaxis in the second/third trimester; consider aerosolized pentamidine in first trimester. Recommend fetal ultrasound at 18–20 weeks after firsttrimester exposure.</td>
</tr>
<tr>
<td>Valacyclovir</td>
<td>B</td>
<td>Not teratogenic in mice, rats, and rabbits. Experience with valacyclovir in pregnancy limited; prodrug of acyclovir, which is considered safe for use in pregnancy.</td>
<td>Treatment of HSV and varicella infections in pregnancy</td>
</tr>
<tr>
<td>Vancomycin</td>
<td>C</td>
<td>Not teratogenic in rats, rabbits. Limited human experience.</td>
<td>Serious bacterial infections</td>
</tr>
