The Panel is composed of approximately 35 voting members who have expertise in the management of HIV in infants, children, and adolescents in early to mid-puberty (sexual maturity rating [SMR] 1–3) who are living with HIV in the United States.

The guidelines provide guidance to HIV care practitioners on the optimal use of antiretroviral (ARV) agents in infants, children, and adolescents in early to mid-puberty (SMR 1–3) who are living with HIV.

### Table 1. Outline of the Guidelines Development Process

<table>
<thead>
<tr>
<th>Topic</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Goal of the Guidelines</td>
<td>The guidelines provide guidance to HIV care practitioners on the optimal use of antiretroviral (ARV) agents in infants, children, and adolescents in early to mid-puberty (SMR 1–3) who are living with HIV in the United States.</td>
</tr>
<tr>
<td>Panel Members</td>
<td>The Panel is composed of approximately 35 voting members who have expertise in the management of HIV infection in infants, children, and adolescents. Members include representatives from the Committee on Pediatric AIDS of the American Academy of Pediatrics and community representatives with knowledge of pediatric HIV infection (e.g., parents and caregivers of children and youth living with HIV). The Panel also includes at least one representative from each of the following Department of Health and Human Services (HHS) agencies: the Centers for Disease Control and Prevention (CDC), the Food and Drug Administration (FDA), the Health Resources and Services Administration (HRSA), and the National Institutes of Health (NIH). A representative from the Canadian Pediatric AIDS Research Group participates as a nonvoting, ex officio member of the Panel. The U.S. government representatives are appointed by their respective agencies; nongovernmental members are selected after an open announcement to call for nominations. Each member serves on the Panel for a 3-year term with an option for reappointment. A list of current members can be found in the Panel Roster.</td>
</tr>
<tr>
<td>Financial Disclosure</td>
<td>All members of the Panel submit an annual financial disclosure statement in writing, reporting any association with manufacturers of ARV drugs or diagnostics used to manage HIV infections. A list of the latest disclosures is available on the AIDSinfo website.</td>
</tr>
<tr>
<td>Users of the Guidelines</td>
<td>Providers of care to infants, children, and adolescents living with HIV in the United States</td>
</tr>
<tr>
<td>Developer</td>
<td>Panel on Antiretroviral Therapy and Medical Management of Children Living with HIV—a working group of the Office of AIDS Research Advisory Council (OARAC)</td>
</tr>
<tr>
<td>Funding Source</td>
<td>Office of AIDS Research, NIH, and HRSA</td>
</tr>
<tr>
<td>Evidence Collection</td>
<td>A standardized review of recent, relevant literature related to each section of the guidelines is performed by a technical assistance consultant (through funding from HRSA) and provided to individual Panel section working groups. The recommendations are generally based on studies published in peer-reviewed journals. The Panel may occasionally use unpublished data to revise the guidelines, particularly when the new information relates to dosing or patient safety. These data come from presentations at major conferences or from the FDA and/or drug manufacturers.</td>
</tr>
<tr>
<td>Recommendation Grading</td>
<td>Described in Table 2</td>
</tr>
<tr>
<td>Method of Synthesizing Data</td>
<td>Each section of the guidelines is assigned to a small group of Panel members with expertise in the area of interest. The members synthesize the available data and propose recommendations to the Panel. The Panel discusses all proposals during monthly teleconferences. Proposals are modified based on Panel discussion and then distributed with ballots to all Panel members for concurrence and additional comments. If there are substantive comments or votes against approval, the recommended changes and areas of disagreement are brought back to the full Panel (by email or teleconference) for additional review, discussion, and further modification to reach a final version that is acceptable to all Panel members. The recommendations in these final versions represent endorsement from a consensus of members and are included in the guidelines as official Panel recommendations.</td>
</tr>
<tr>
<td>Other Guidelines</td>
<td>These guidelines focus on infants, children, and adolescents in early-to-mid-puberty (SMR 1–3) who are living with HIV. Guidelines for the treatment of adolescents in late puberty (SMR 4–5) are provided by the Panel on Antiretroviral Guidelines for Adults and Adolescents. Separate guidelines outline the use of antiretroviral therapy (ART) in pregnant women with HIV infection (including maternal and infant interventions to prevent perinatal transmission), ART for nonpregnant adults and postpubertal adolescents with HIV infection, and ARV prophylaxis for those who experience occupational or nonoccupational exposure to HIV. These guidelines are also available on the AIDSinfo website.</td>
</tr>
<tr>
<td>Update Plan</td>
<td>The full Panel meets monthly by teleconference to review data that may warrant modification of the guidelines. Smaller working groups of Panel members hold additional teleconferences to review individual drug sections or other specific topics (e.g., What to Start). Updates may be prompted by new drug approvals (or new indications, formulations, or frequency of dosing), new significant safety or efficacy data, or other information that may have a significant impact on the clinical care of patients. In the event of significant new data that may affect patient safety, the Panel may issue a warning announcement and post accompanying recommendations on the AIDSinfo website until the guidelines can be updated with appropriate changes. All sections of the guidelines will be reviewed at least once a year, with updates as appropriate.</td>
</tr>
<tr>
<td>Public Comments</td>
<td>A 2-week public comment period follows the release of the updated guidelines on the AIDSinfo website. The Panel reviews these comments to determine whether additional revisions to the guidelines are indicated. The public may also submit comments to the Panel at any time at <a href="mailto:contactus@aidsinfo.nih.gov">contactus@aidsinfo.nih.gov</a>.</td>
</tr>

* See text for details on recommended laboratory tests to perform.
* A patient's ability to adhere to an ARV regimen is assessed prior to starting ART. If abacavir is being considered as part of the regimen, send HLA-B*5701 testing prior to initiating abacavir and choose an alternative ARV drug if the patient is HLA-B*5701 positive (see the abacavir section in Appendix A: Pediatric Antiretroviral Drug Information). Genotype resistance testing is recommended if it has not already been performed (see Drug-Resistance Testing in the Adult and Adolescent Antiretroviral Guidelines). Send tests that are appropriate for the toxicity profile that is associated with a patient's ART regimen and the patient's medical history (see text).
* If ART is initiated within 30 days to 90 days of a pre-therapy lab result, repeat testing may not be necessary.
* CD4 cell count, CBC, and chemistries can be monitored less frequently (every 6 months–12 months) in children and youth who are adherent to therapy, who have CD4 cell values that are well above the threshold for OI risk, and who have had sustained virologic suppression and stable clinical status for more than 2 years to 3 years. Viral load testing every 3 to 4 months is generally recommended to monitor ARV adherence.
* If lipid levels have been abnormal in the past, more frequent monitoring might be needed. For patients treated with TDF, more frequent urinalysis should be considered.
* Chemistries refer to a comprehensive metabolic panel.
* Random plasma glucose is collected in a gray-top blood collection tube or other designated tube.
* This screening is only recommended for individuals who have previously demonstrated no immunity to hepatitis B and who are initiating a regimen that contains ARV drugs with activity against hepatitis B, specifically lamivudine, emtricitabine, TAF, or TDF.

See the Adult and Adolescent Antiretroviral Guidelines, as well as Preconception Counseling and Care for Women of Childbearing Age Living with HIV in the Perinatal Guidelines.

Key to Acronyms: ART = antiretroviral therapy; ARV = antiretroviral; CBC = complete blood count; CD4 = CD4 T lymphocyte; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate; OI = opportunistic infection.
### Table 4. Primary, Food and Drug Administration-Approved Assays for Monitoring Viral Load

### AIDS-Defining Conditions, continued

- Cervical cancer, invasive<sup>b</sup>
- Coccidioidomycosis, disseminated or extrapulmonary
- Cryptococcosis, extrapulmonary
- Cryptosporidiosis, chronic intestinal (>1 month duration)
- CMV disease (other than liver, spleen, or lymph nodes), onset at age >1 month
- CMV retinitis (with loss of vision)
- Encephalopathy attributed to HIV<sup>c</sup>
- HSV: chronic ulcers (>1 month duration) or bronchitis, pneumonitis, or esophagitis (onset at age >1 month)
- Histoplasmosis, disseminated or extrapulmonary
- Isosporiasis, chronic intestinal (>1 month duration)
- Kaposi sarcoma
- Lymphoma, Burkitt (or equivalent term)
- Lymphoma, immunoblastic (or equivalent term)
- Lymphoma, primary, of brain
- *Mycobacterium avium* complex or *Mycobacterium kansasii*, disseminated or extrapulmonary
- *Mycobacterium tuberculosis* of any site, pulmonary, disseminated, or extrapulmonary
- *Mycobacterium*, other species or unidentified species, disseminated or extrapulmonary
- *Pneumocystis jirovecii* (previously known as *Pneumocystis carinii*) pneumonia
- Pneumonia, recurrent<sup>b</sup>
- Progressive multifocal leukoencephalopathy
- Salmonella septicemia, recurrent
- Toxoplasmosis of brain, onset at age >1 month
- Wasting syndrome attributed to HIV<sup>c</sup>

<sup>a</sup> Only among children aged <6 years.

<sup>b</sup> Only among adults, adolescents, and children aged ≥6 years.

<sup>c</sup> Suggested diagnostic criteria for these illnesses, which might be particularly important for HIV encephalopathy and HIV wasting syndrome, are described in the following references:

Centers for Disease Control and Prevention. 1994 Revised classification system for human immunodeficiency virus infection in children less than 13 years of age. *MMWR*. 1994;43(No. RR-12).

**Key to Acronyms:** CDC = Centers for Disease Control and Prevention; CMV = cytomegalovirus; HSV = herpes simplex virus

**Modified from:**

Centers for Disease Control and Prevention. 1994 revised classification system for human immunodeficiency virus infection in children less than 13 years of age. *MMWR*. 1994;43(No. RR-12).

Table 7. Antiretroviral Regimens Recommended for Initial Therapy for HIV Infection in Children

An ART regimen for treatment-naive children is generally made up of a two-NRTI backbone and either one NNRTI or one INSTI or one PI boosted with RTV or COBI. Preferred regimens are designated based on efficacy, ease of administration, and acceptable toxicity. Alternative regimens have also demonstrated efficacy, but clinical experience with these regimens is limited or these regimens are more difficult to administer than Preferred regimens. Regimens should be tailored to the individual patient by weighing the advantages and disadvantages of each combination. Many agents have multiple formulations and age and weight recommendations. Please consult Appendix A: Pediatric Antiretroviral Drug Information for additional information and recommended dosages and formulations (see Table 8 below).

Children who are receiving effective and tolerable ART regimens can continue using those regimens as they age, even if the combinations they are receiving are no longer Preferred regimens.

<sup>1</sup> If treatment is scheduled to begin before a patient is aged 14 days, NVP or RAL are *Preferred* agents because they are the only options with dosing information available for this age group. While many pediatric experts favor initiating ART as soon as possible after birth in order to limit the establishment of viral reservoirs, available clinical trial data does not suggest that initiating treatment within the first 14 days of life leads to better clinical outcomes than initiating treatment after 14 days of age. Clinicians should consult an expert in pediatric HIV infection before initiating treatment in infants aged <14 days. Additional considerations regarding the use of NVP or RAL in infants aged <14 days can be found in [Antiretroviral Management of Newborns with Perinatal HIV Exposure or Perinatal HIV](https://aidsinfo.nih.gov/guidelines). Switching from NVP to LPV/r should be considered when the infant is aged ≥14 days with a postmenstrual age of 42 weeks (the span of time between the first day of the mother’s last menstrual period and birth, plus the time elapsed after birth); LPV/r has produced better clinical outcomes in studies of children aged <3 years than NVP. Data are limited on the clinical outcomes of using RAL in infants and children aged <2 years.

<sup>2</sup> LPV/r should not be administered to neonates before a postmenstrual age of 42 weeks and postnatal age ≥14 days.

<sup>3</sup> RAL pills or chewable tablets can be used in children aged ≥2 years. Granules can be administered in infants and children from birth to age 2 years. No dosing information is available for preterm infants or those with a weight of <2 kg at birth.

<sup>4</sup> DRV should only be used in children weighing ≥10 kg. Once-daily DRV should not be used in children aged <12 years or weighing <40 kg. Once-daily DRV should also not be used when any one of the following resistance-associated substitutions are present: V11I, V32I, L33F, I47V, I50V, I54L, I54M, T74P, T74R, L76V, I84V, and L89V. DRV/r is recommended as an *Alternative* drug combination for children aged ≥6 years to <12 years and weighing >25 kg, because there are other drugs that can be administered once daily and that are better tolerated. Note that DRV/r can be administered once daily in adolescents aged ≥12 years and weighing ≥40 kg who are not sexually mature (SMR 1–3).

<sup>5</sup> EVG is currently recommended only as a component of FDC tablets. Tablets containing EVG/COBI/FTC/TAF are recommended as a *Preferred* regimen for children and adolescents weighing ≥35 kg, and as an *Alternative* regimen for children and adolescents weighing ≥25 kg.

<sup>6</sup> DTG is recommended as a *Preferred* agent for children and adolescents weighing ≥25 kg. An FDC tablet containing ABC/DTG/3TC (Triumeq) is available.

<sup>7</sup> NVP should not be used in post-pubertal girls with CD4 cell counts >250/mm³, unless the benefit clearly outweighs the risk. NVP is approved by the FDA for treatment of infants aged ≥15 days.

<sup>8</sup> EFV is approved by the FDA for use in children aged ≥3 months and weighing ≥3.5 kg, but it is *not recommended* by the Panel for initial therapy in children aged ≥3 months to 3 years. An FDC tablet containing EFV/FTC/TDF (Atripla) and EFV 600 mg/3TC/TDF (Symfi) is available. See efavirenz section for information about use of the FDC EFV 400 mg/3TC TDF (Symfi Lo).

<sup>9</sup> FDA-approved FDCs are not included in this table when they are not approved for use in the specific patient populations being discussed.

<sup>10</sup> RPV should be administered to adolescents aged ≥12 years and weighing ≥35 kg who have initial viral loads ≤100,000 copies/mL. FDC tablets containing FTC/RPV/TAF (Odefsey) and FTC/RPV/TDF (Complera) are available.

<sup>11</sup> An FDC containing 3TC/ZDV (Combivir and generic) is available.

<sup>12</sup> An FDC containing ABC/3TC (Epzicom and generic) is available.

<sup>13</sup> FTC/TAF is recommended as a *Preferred* combination for children and adolescents weighing ≥25 kg; an FDC containing FTC/TAF is available. FTC/TAF is approved by the FDA for children weighing ≥25 kg when used in the single-tablet regimen EVG/COBI/FTC/TAF or as TAF/FTC in combination with an NNRTI or INSTI. FTC/TAF plus a boosted PI is only recommended for use in children and adolescents weighing ≥35 kg.

<sup>14</sup> An FDC containing FTC/TDF (Truvada) is available.

**Key to Acronyms:**

- 3TC = lamivudine
- ABC = abacavir
- ATV/r = atazanavir/ritonavir
- ART = antiretroviral therapy
- CD4 = CD4 T lymphocyte
- COBI = cobicistat
- DRV = darunavir
- DTG = dolutegravir
- EFV = efavirenz
- EVG = elvitegravir
- FDA = Food and Drug Administration
- FTC = fixed-dose combination
- INSTI = integrase strand transfer inhibitor
- LPV/r = lopinavir/ritonavir
- NNRTI = non-nucleoside reverse transcriptase inhibitor
- NRTI = nucleoside reverse transcriptase inhibitor
- NVP = nevirapine
- PI = protease inhibitor
- RAL = raltegravir
- RPV = rilpivirine
- SMR = sexual maturity rating
- TAF = tenofovir alafenamide
- TDF = tenofovir disoproxil fumarate
- ZDV = zidovudine
Table 8. Advantages and Disadvantages of Antiretroviral Components Recommended for Initial Therapy in Children

See Appendix A: Pediatric Antiretroviral Drug Information and Table 7. Antiretroviral Regimen Considerations for Initial Therapy Based on Specific Clinical Scenarios in the Adult and Adolescent Antiretroviral Guidelines for more information.

<td>All INSTIs</td>
<td><strong>INSTI Class Advantages:</strong>  • Few drug-drug interactions  • Well-tolerated</td>
<td><strong>INSTI Class Disadvantages:</strong>  • Limited data on pediatric dosing or safety</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
|           | DTG | Once-daily administration  
Can give with food  
Available in FDC tablets (see Fixed-Dose Combinations)  
Single-agent DTG pills are available in several dosages and are small in size. | Drug interactions with EFV, FPV/r, TPV/r, and rifampin, necessitating twice-daily dosing of DTG  
CNS side effects, particularly sleep disturbances and possible increased risk of neural tube defects in infants born to women who were receiving dolutegravir at the time of conception |
|           | EVG | Once-daily administration  
Available in FDC tablets (see Fixed-Dose Combinations) | Among INSTIs, EVG has the lowest barrier to the development of resistance.  
If EVG is administered with COBI, there is potential for multiple drug interactions because COBI is metabolized by hepatic enzymes (e.g., CYP3A4).  
COBI inhibits tubular secretion of creatinine, and this may result in increased serum creatinine but normal glomerular clearance. |
|           | RAL | Can give with food  
Available in tablet, chewable tablet, and powder formulations  
Once-daily administration (with RAL HD) can be used for treatment-naive or virologically suppressed children weighing ≥50 kg. | Potential for rare systemic allergic reaction or hepatitis  
Granule formulation requires a multistep preparation before administration; caregiver must be taught how to properly prepare this formulation. |
| NNRTIs In Alphabetical Order | All NNRTIs | **NNRTI Class Advantages:**  • Long half-life  • Lower risk of dyslipidemia and fat maldistribution than PIs  • PI-sparing  • Lower pill burden than PIs for children taking the solid formulation; easier to use and adhere to than PI-based regimens | **NNRTI Class Disadvantages:**  • A single mutation can confer resistance, with cross-resistance between EFV and NVP.  • Rare but serious and potentially life-threatening cases of skin rash, including SJS, and hepatic toxicity. All NNRTIs pose this risk, but the risk is greatest with NVP.  • Potential for multiple drug interactions due to metabolism via hepatic enzymes (e.g., CYP3A4) |
|           | EFV | Once-daily administration  
Available in FDC tablets (see Fixed-Dose Combinations)  
Potent ARV activity  
Can give with food (but avoid high-fat meals)  
Capsules can be opened and added to food. | Neuropsychiatric AEs (bedtime dosing is recommended to reduce CNS effects)  
Rash (generally mild)  
No commercially available liquid formulation  
Limited data on dosing for children aged <3 years  
No data on dosing for children aged <3 months |
Table 8. Advantages and Disadvantages of Antiretroviral Components Recommended for Initial Therapy in Childrena (page 2 of 4)

<table>
<thead>
<tr>
<th>ARV Class</th>
<th>ARV Agent(s)</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>NNRTIs</td>
<td>NVP</td>
<td>Liquid formulation is available. Dosing information for young infants is available. Can give with food Extended-release formulation is available that allows for once-daily dosing in older children.</td>
<td>Reduced virologic efficacy in young infants, regardless of exposure to NVP as part of a peripartum preventive regimen Higher incidence of rash/HSR than other NNRTIs Higher rates of serious hepatic toxicity than EFV Decreased virologic response compared with EFV Twice-daily dosing necessary in children with BSA &lt;0.58 m²</td>
</tr>
<tr>
<td></td>
<td>RPV</td>
<td>Once-daily dosing Available in FDC tablets (see Fixed-Dose Combinations)</td>
<td>Should not use in patients with HIV viral loads &gt;100,000 copies/mL Must be taken with a ≥500 kcal meal at a consistent time each day; this may affect adherence. Low barrier for resistance</td>
</tr>
<tr>
<td>PIs</td>
<td>All PIs</td>
<td>PI Class Advantages: • NNRTI-sparing • Clinical, virologic, and immunologic efficacy are well-documented. • Resistance to PIs requires multiple mutations. • When combined with a dual-NRTI backbone, a regimen containing a PI targets HIV at two steps of viral replication by inhibiting the activity of viral reverse transcriptase and protease enzymes.</td>
<td>PI Class Disadvantages: • Metabolic complications, including dyslipidemia, fat maldistribution, and insulin resistance • Potential for multiple drug interactions because of metabolism via hepatic enzymes (e.g., CYP3A4) • Higher pill burden than NRTI-based or NNRTI-based regimens for patients taking solid formulations • Poor palatability of liquid preparations, which may affect adherence • Most PIs require RTV boosting, resulting in drug interactions that are associated with RTV.</td>
</tr>
<tr>
<td>Boosted ATV</td>
<td>Booster ATV</td>
<td>Once-daily dosing Powder formulation is available. ATV has less effect on TG and total cholesterol levels than other PIs (but RTV boosting may be associated with elevations in these parameters).</td>
<td>No liquid formulation Should be administered with food Indirect hyperbilirubinemia is common, but asymptomatic. Scleral icterus may be distressing to the patient, which may affect adherence. Must be used with caution in patients with preexisting conduction system defects (can prolong PR interval of ECG). RTV is associated with a large number of drug interactions.</td>
</tr>
<tr>
<td>Boosted DRV</td>
<td>Booster DRV</td>
<td>Can be used once daily in children aged ≥12 years Liquid formulation is available. DRV requires a boosting agent. Available in FDC tablets (see Fixed-Dose Combinations)</td>
<td>Pediatric pill burden high with current tablet dose formulations Should be administered with food Must be boosted to achieve adequate plasma concentrations Contains sulfa moiety. The potential for cross-sensitivity between DRV and other drugs in sulfonamide class is unknown. RTV is associated with a large number of drug interactions. Can only be used once daily in the absence of certain PI-associated resistance mutations</td>
</tr>
</tbody>
</table>

<th>ARV Class</th>
<th>ARV Agent(s)</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIs</td>
<td>LPV/r</td>
<td>LPV is only available coformulated with RTV in liquid and tablet formulations. Tablets can be given without regard to food, but they may be better tolerated when taken with meal or snack.</td>
<td>Poor palatability of liquid formulation (bitter taste), although the palatability of the FDC is better than RTV alone. Liquid formulation should be administered with food. RTV is associated with a large number of drug interactions. Should not be administered to neonates before a postmenstrual age (the span of time between the first day of the mother’s last menstrual period and birth, plus the time elapsed after birth) of 42 weeks and a postnatal age $\geq 14$ days. Must be used with caution in patients with pre-existing conduction system defects (can prolong PR and QT interval of ECG).</td>
</tr>
<tr>
<td>Dual-NRTI Backbones</td>
<td>ABC plus (3TC or FTC)</td>
<td>Palatable liquid formulations Can give with food Available in FDC tablets (see Fixed-Dose Combinations)</td>
<td>Risk of ABC HSR; perform HLA-B*5701 screening before initiation of ABC treatment. Limited data on the safety and efficacy of this combination in children Increased lipid levels</td>
</tr>
<tr>
<td>FTC/TAF for children aged $\geq 6$ years</td>
<td>Once-daily dosing Small tablet size Lower risk of TFV-associated renal and bone toxicity with TAF than with TDF in adults Available in FDC tablets (see Fixed-Dose Combinations)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TDF plus (3TC or FTC) for adolescents with SMR 4 or 5</td>
<td>Once-daily dosing for TDF Resistance is slow to develop. Lower risk of mitochondrial toxicity than other NRTIs Can give with food Available as reduced-strength tablets and oral powder for use in younger children Available in FDC tablets (see Fixed-Dose Combinations)</td>
<td>Limited pediatric experience Potential bone and renal toxicity Appropriate dosing is complicated by numerous drug-drug interactions with other ARV agents, including ddI, LPV/r, ATV, and TPV.</td>
<td></td>
</tr>
<tr>
<td>ZDV plus (3TC or FTC)</td>
<td>Extensive pediatric experience Coformulations of ZDV and 3TC are available (Combidiv and generic) for children weighing $\geq 30$ kg. Palatable liquid formulations Can give with food FTC is available as a palatable liquid formulation that can be administered once daily.</td>
<td>Bone marrow suppression with ZDV Lipatroph with ZDV</td>
<td></td>
</tr>
<tr>
<td>ZDV plus ABC</td>
<td>Palatable liquid formulations Can give with food</td>
<td>Risk of ABC HSRS; perform HLA-B*5701 screening before initiation of ABC treatment. Bone marrow suppression and lipoatroph with ZDV</td>
<td></td>
</tr>
</tbody>
</table>

</table>

Key to Acronyms: 3TC = lamivudine; ABC = abacavir; ART = antiretroviral therapy; ARV = antiretroviral; CD4 = CD4 T lymphocyte; d4T = stavudine; ddi = didanosine; DRV = darunavir; FTC = emtricitabine; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside reverse transcriptase inhibitor; NVP = nevirapine; TDF = tenofovir disoproxil fumarate; ZDV = zidovudine
Table 11. Newborn Antiretroviral Management According to Risk of HIV Infection in the Newborn

Drug selection and dosing considerations are related to the age and gestational age of the newborn. Consultation is available through the National Perinatal HIV Hotline (888-448-8765).

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
<th>Neonatal ARV Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low Risk of Perinatal HIV Transmission</td>
<td>• Mothers who received ART during pregnancy with sustained viral suppression near delivery and no concerns related to adherence</td>
<td>ZDV for 4 weeks</td>
</tr>
</tbody>
</table>
| Higher Risk of Perinatal HIV Transmission<sup>a,b</sup> | • Mothers who received neither antepartum nor intrapartum ARV drugs  
• Mothers who received only intrapartum ARV drugs  
• Mothers who received antepartum and intrapartum ARV drugs but who have detectable viral load near delivery, particularly if delivery was vaginal  
• Mothers with acute or primary HIV infection during pregnancy or breastfeeding (in which case, the mother should discontinue breastfeeding)<sup>c</sup> | 2-drug ARV prophylaxis (<sup>NICHD-HPTN 040/PACTG 1043 regimen</sup>) with 6 weeks ZDV and 3 doses of NVP (prophylactic dosage, with doses given within 48 hours of birth, 48 hours after first dose, and 96 hours after second dose)  
or  
Empiric HIV therapy using either ZDV, 3TC, and NVP (treatment dosage) or ZDV, 3TC, and RAL administered from birth to age 6 weeks<sup>g</sup> |
| Presumed Newborn HIV Exposure | • Mothers with unknown HIV status who test HIV positive at delivery or postpartum or whose newborns have a positive HIV antibody test | ARV management as above (for higher risk of perinatal HIV transmission)  
Infant ARVs should be discontinued immediately if supplemental testing confirms that the mother does not have HIV. |
| Newborn with HIV<sup>e</sup> | • Positive newborn HIV virologic test/NAT | 3-drug ARV regimen using treatment dosages |

<sup>a</sup> See text for evidence supporting a 2-drug ARV prophylaxis regimen and empiric HIV therapy.

<sup>b</sup> See the Intrapartum care section for guidance on indications for scheduled cesarean delivery and intrapartum IV ZDV to reduce the risk of perinatal HIV transmission for mothers with an elevated viral load at delivery.

<sup>c</sup> Most Panel members would opt to administer empiric HIV therapy to infants whose mothers had acute HIV during pregnancy because of the higher risk for in utero transmission. If acute HIV is diagnosed during breastfeeding, mother should stop breastfeeding.

<sup>d</sup> The optimal duration of empiric HIV therapy in newborns at higher risk of perinatal HIV transmission is unknown. Some Panel members opt to discontinue NVP, RAL, and/or 3TC when a birth NAT returns negative, while others would continue empiric HIV therapy for infants at highest risk of HIV acquisition for 6 weeks. In all cases, ZDV should be continued for 6 weeks. It is recommended that providers consult with an expert in pediatric HIV infection to determine therapy duration based on case-specific risk factors and interim HIV NAT results.

<sup>e</sup> Most Panel members do not recommend delaying the initiation of ART pending results of the confirmatory HIV NAT, given low likelihood of a false-positive HIV NAT.

**Note:** ARV drugs should be initiated as close to the time of birth as possible, preferably within 6 to 12 hours of delivery. See Table 12 for dosing specifics.

**Key to Acronyms:** 3TC = lamivudine; ART = antiretroviral therapy; ARV = antiretroviral; IV = intravenous; NAT = nucleic acid test; NVP = nevirapine; the Panel = Panel on Treatment of Pregnant Women with HIV Infection and Prevention of Perinatal Transmission; RAL = raltegravir; ZDV = zidovudine

<sup>a</sup> The optimal duration of empiric HIV therapy in newborns at higher risk of perinatal HIV transmission is unknown. Some Panel members opt to discontinue NVP, RAL, and/or 3TC when birth NAT returns negative, while others would continue empiric HIV therapy for infants at the highest risk of HIV acquisition for 6 weeks. In all cases in which the newborn is at higher risk of HIV acquisition, ZDV should be continued for 6 weeks. Consultation with an expert in pediatric HIV to select a therapy duration based on case-specific risk factors and interim HIV NAT results is recommended.

<sup>Notes</sup>: If the mother has taken RAL 2–24 hours prior to delivery, the neonate’s first dose of RAL should be delayed until 24–48 hours after birth; additional ARVs should be started as soon as possible.

<sup>b</sup> Investigational NVP treatment dose recommended by the Panel; FDA has not approved a dose of NVP for infants <1 month of age.

<sup>c</sup> RAL dosing is increased at 1 and 4 weeks of age because metabolism by UGT1A1 is low at birth and increases rapidly during the next 4 to 6 weeks of life. No dosing information is available for preterm or low birthweight infants.

**Key to Acronyms:**
- 3TC = lamivudine
- ARV = antiretroviral
- BSA = body surface area
- FDA = Food and Drug Administration
- IV = intravenous
- N/A = no recommendation
- NAT = nucleic acid test
- NVP = nevirapine
- Panel = the Panel on Treatment of Pregnant Women with HIV Infection and Prevention of Perinatal Transmission
- RAL = raltegravir
- UGT1A1 = uridine diphosphate glucotransferase
- ZDV = zidovudine

#### Approaches to Monitoring Medication Adherence in Research Settings

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measure drug concentrations in hair. This is a good measure of adherence over time.</td>
</tr>
<tr>
<td>Use electronic monitoring devices. These include MEMS caps and Wisepill.</td>
</tr>
<tr>
<td>Use cell phone-based technologies. These include interactive voice response, text messaging, and mobile apps.</td>
</tr>
</tbody>
</table>

---

*a See Clinical and Laboratory Monitoring of Pediatric HIV Infection regarding the frequency of adherence assessment after initiating or changing therapy.

**Key to Acronyms:** apps = applications; DOT = directly observed therapy; MEMS = Medication Event Monitoring System
Table 14. Strategies to Improve Adherence to Antiretroviral Medications

<table>
<thead>
<tr>
<th>Initial Intervention Strategies</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Establish trust and identify mutually acceptable goals for care.</td>
</tr>
<tr>
<td>• Obtain explicit agreement on the need for treatment and adherence.</td>
</tr>
<tr>
<td>• Identify depression, low self-esteem, substance abuse, or other mental health issues in the child/adolescent and/or the caregiver that may affect adherence. Evaluate and initiate treatment for mental health issues before starting ARV drugs, if possible.</td>
</tr>
<tr>
<td>• Identify family, friends, health team members, and others who can support adherence.</td>
</tr>
<tr>
<td>• Educate the patient and family about the critical role of adherence in therapy outcome, including the relationship between partial adherence and resistance and the potential impact on future drug regimen choices. Develop a treatment plan that the patient and family understand and to which they feel committed.</td>
</tr>
<tr>
<td>• Work with the patient and family to make specific plans for taking medications as prescribed and for supporting adherence. Assist them to arrange for administration in day care, school, and other settings, when needed. Consider home delivery of medications.</td>
</tr>
<tr>
<td>• Establish a patient's readiness to take medication by staging practice sessions or by other means.</td>
</tr>
<tr>
<td>• Schedule a home visit to review medications and determine how they will be administered in the home setting.</td>
</tr>
<tr>
<td>• In certain circumstances, consider a brief period of hospitalization at the start of therapy for patient education and to assess the tolerability of the chosen medications.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Medication Strategies</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Choose the simplest regimen possible, reducing dosing frequency, pill size, and number of pills. (see Appendix A, Table 1 and Appendix A, Table 2)</td>
</tr>
<tr>
<td>• When choosing a regimen, consider the patient’s daily and weekly routines and potential variations in patient and family activities.</td>
</tr>
<tr>
<td>• Choose the most palatable medicine possible (pharmacists may be able to add syrups or flavoring agents to increase palatability).</td>
</tr>
<tr>
<td>• Choose drugs with the fewest AEs; provide anticipatory guidance for management of AEs.</td>
</tr>
<tr>
<td>• Simplify food requirements for medication administration.</td>
</tr>
<tr>
<td>• Prescribe drugs carefully to avoid adverse drug-drug interactions.</td>
</tr>
<tr>
<td>• Assess pill-swallowing capacity and offer pill-swallowing training and aids (e.g., pill-swallowing cup, pill glide). Adjust pill size as needed.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Follow-up Intervention Strategies</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Have more than one member of the multidisciplinary team monitor adherence at each visit and in between visits by telephone, email, text, and social media, as needed.</td>
</tr>
<tr>
<td>• Provide ongoing support, encouragement, and understanding of the difficulties associated with maintaining adherence to daily medication regimens.</td>
</tr>
<tr>
<td>• Use patient education aids, including pictures, calendars, and stickers.</td>
</tr>
<tr>
<td>• Encourage use of pill boxes, reminders, mobile apps, alarms, and timers.</td>
</tr>
<tr>
<td>• Provide follow-up clinic visits, telephone calls, and text messages to support and assess adherence.</td>
</tr>
<tr>
<td>• Provide access to support groups, peer groups, or one-on-one counseling for caregivers and patients, especially for those with known depression or drug use issues that are known to decrease adherence.</td>
</tr>
<tr>
<td>• Provide pharmacist-based adherence support, such as medication education and counseling, blister packs, refill reminders, automatic refills, and home delivery of medications.</td>
</tr>
<tr>
<td>• Consider DOT at home, in the clinic, or in certain circumstances, such as during a brief inpatient hospitalization.</td>
</tr>
<tr>
<td>• Consider gastrostomy tube use in certain circumstances.</td>
</tr>
<tr>
<td>• Information on other interventions to consider can be found at the Complete Listing of Medication Adherence Evidence-Based Behavioral Interventions on the CDC's website.</td>
</tr>
<tr>
<td>• Consult the CDC Every Dose Every Day toolkit.</td>
</tr>
</tbody>
</table>

</tr>
</thead>
<tbody>
<tr>
<td><strong>Dyslipidemia</strong></td>
<td><strong>PIs:</strong> All PIs, especially RTV-boosted PIs; lower incidence reported with DRV/r and ATV with or without RTV.</td>
<td><strong>Onset:</strong> As early as 2 weeks to months after beginning therapy</td>
<td><strong>Presentation</strong></td>
<td><strong>Advanced-stage HIV disease</strong></td>
<td><strong>Prevention:</strong></td>
<td><strong>Assess all patients for additional CVD risk factors. Patients living with HIV are considered to be at moderate risk of CVD.</strong></td>
</tr>
<tr>
<td></td>
<td><strong>NRTIs:</strong> Lower incidence with TDF than with TAF</td>
<td><strong>pi:</strong> ↑ LDL-C, TC, and TG</td>
<td><strong>Reported frequency varies with specific ARV regimen, duration of ART, and the specific laboratory parameters used to diagnose lipid abnormalities.</strong></td>
<td><strong>High-fat, high-cholesterol diet</strong></td>
<td><strong>When possible, use ARVs associated with a lower prevalence of dyslipidemia. These include INSTIs and newer PIs (e.g., ATV, DRV).</strong></td>
<td><strong>ART regimen changes should be considered, especially when the patient is receiving older PIs (e.g., LPV/r) and/or ritonavir boosting. Substituting a PI-sparing regimen, a PI-based regimen with a more favorable lipid profile, or COBI boosting causes a decline in LDL-C or TG values. However, the lipid-lowering effect for LDL-C is less pronounced than treatment results with statin therapy.</strong></td>
</tr>
<tr>
<td></td>
<td><strong>NNRTIs:</strong> Lower incidence reported with NVP, RPV, and ETR than with EFV</td>
<td><strong>Presentation NNRTIs:</strong> ↑ LDL-C, TC, and HDL-C</td>
<td><strong>40% to 75% of older children and adolescents with prolonged ART history will have lipid abnormalities.</strong></td>
<td><strong>Lack of exercise</strong></td>
<td><strong>Refer patients to a lipid specialist early if LDL-C ≥250 mg/dL or TG ≥500 mg/dL.</strong></td>
<td><strong>If LDL-C is ≥130 mg/dL but &lt;250 mg, or TG is ≥150 mg/dL but &lt;500 mg/dL, a staged treatment approach is recommended by the NHLBI guidelines.</strong></td>
</tr>
<tr>
<td></td>
<td><strong>NRTIs:</strong> Lower incidence reported with TDF than with TAF</td>
<td><strong>Presentation NRTIs:</strong> ↑ LDL-C, TC, and TG</td>
<td><strong>Higher abnormal fasting serum lipids have been observed in ART-naive adults who received EVG/COBI/FTC/TAF than in those who received EVG/COBI/FTC/TDF.</strong></td>
<td><strong>Obesity</strong></td>
<td><strong>Implement diet, nutrition, and lifestyle management for 6 months to 9 months. Consult with a dietician if one is available.</strong></td>
<td><strong>If a 6-month to 9-month trial of lifestyle modification fails and the patient is aged ≥10 years, consider implementing lipid-lowering therapy after consulting a lipid specialist.</strong></td>

</tr>
</tbody>
</table>

• If there are minimal alterations in AST, ALT, and CK, monitor every 3 months–4 months during the first year and every 6 months thereafter (or as clinically indicated).

• Repeat FLP 4 weeks after increasing doses of antihyperlipidemic agents.

• Statin therapy should be considered for patients with elevated LDL-C levels. NHLBI provides recommendations for statin therapy in patients with specific LDL-C levels and risk factors.  

• Drug therapy can be considered in cases of severe hypertriglyceridemia (TG ≥500 mg/dL). Fibrates (gemfibrozil and fenofibrate) and N-3 PUFAs derived from fish oils may be used.

The long-term risks of lipid abnormalities in children receiving ART are unclear. However, persistent dyslipidemia in children may lead to premature CVD.

---

* Given the burden of collecting fasting blood samples, some practitioners routinely measure cholesterol and triglycerides from nonfasting blood samples and follow up abnormal values with a test done in the fasted state.

**Key to Acronyms:**

- ALT = alanine aminotransferase; ART = antiretroviral therapy; ARV = antiretroviral; AST = aspartate aminotransferase; ATV = atazanavir; CK = creatine kinase; COBI = cobicistat; CVD = cardiovascular disease; DRV = darunavir; DRV/r = darunavir/ritonavir; EFV = efavirenz; ETR = etravirine; EVG = elvitegravir; FLP = fasting lipid profile; FTC = emtricitabine; HDL-C = high-density lipoprotein cholesterol; INSTI = integrase strand transfer inhibitor; LDL-C = low-density lipoprotein cholesterol; LFT = liver function test; LPV/r = lopinavir/ritonavir; NHLBI = National Heart, Lung, and Blood Institute; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside reverse transcriptase inhibitor; NVP = nevirapine; PI = protease inhibitor; PUFA = polyunsaturated fatty acid; RPV = rilpivirine; RTV = ritonavir; TAF = tenofovir alafenamide; TC = total cholesterol; TDF = tenofovir disoproxil fumarate; TG = triglyceride

<tr>
<td>Nausea/Vomiting</td>
<td>All ARV drugs, but most notably RTV-boosted PIs</td>
<td>Onset: • Early Presentation: • Nausea and emesis, both of which may be associated with anorexia and/or abdominal pain</td>
<td>Varies with ARV agent; generally &lt;15%</td>
<td>Unknown</td>
<td>Instruct patient to take PIs with food. Monitor for weight loss and ARV adherence.</td>
<td>Reassure patient that these adverse effects generally improve over time (usually 6–8 weeks). Consider switching to ARV drugs with smaller tablet sizes (see Appendix A, Table 2). Provide supportive care. In extreme or persistent cases, use antiemetics or switch to another ARV regimen.</td>
</tr>
<tr>
<td>Diarrhea</td>
<td>All ARV drugs, but most notably RTV-boosted PIs</td>
<td>Onset: • Early Presentation: • More frequent bowel movements and stools that are generally soft</td>
<td>Varies with ARV agent; generally &lt;15%</td>
<td>Unknown</td>
<td>Monitor for weight loss and dehydration.</td>
<td>If prolonged or severe, exclude infectious or noninfectious (e.g., lactose intolerance) causes of diarrhea. Reassure patient that this adverse effect generally improves over time (usually 6–8 weeks). Consider switching to another ARV regimen in persistent and severe cases. Treatment data in children are lacking; however, the following strategies may be useful when the ARV regimen cannot be changed: • Dietary modification • Using bulk-forming agents (e.g., psyllium) • Using antimotility agents (e.g., loperamide) • Using crofelemer, which is approved by the FDA to treat ART-associated diarrhea in adults aged ≥18 years; no pediatric data are available.</td>
</tr>

| Neutropeniaa     | ZDV             | Onset:  
• Variable  
Presentation:  
• Asymptomatic  
Newborns Exposed to HIV:  
• Rare  
Children with HIV Who Are Taking ARV Drugs:  
• 2% to 4% of children on ARV drugs  
• Highest rates occur in children on ZDV-containing regimens  
Children with HIV Who Are Taking ARV Drugs:  
• Advanced or poorly controlled HIV infection  
• Myelosuppressive drugs (e.g., TMP-SMX, ganciclovir, hydroxyurea, rifabutin)  
Newborns Exposed to HIV:  
• In utero exposure to ARV drugs  
• Combination ARV prophylaxis, particularly with ZDV plus 3TC  | Children with HIV Who Are Taking ARV Drugs:  
• Obtain CBC as part of routine care.  
Children with HIV Who Are Taking ARV Drugs:  
• No established threshold for intervention; some experts would consider using an alternative NRTI for prophylaxis if ANC reaches <500 cells/mm³.  
ZDV administration can be limited to 4 weeks in low-risk neonates (see Antiretroviral Management of Newborns with Perinatal HIV Exposure or Perinatal HIV).  
Children with HIV Who Are Taking ARV Drugs:  
• Discontinue non-ARV, marrow-toxic drugs, if feasible.  
• Treat coexisting OIs and malignancies.  
• For persistent, severe neutropenia that is thought to be associated with ARV drugs, change to a regimen that does not contain ZDV.  | Newborns Exposed to HIV:  
• Rare  
Children with HIV Who Are Taking ARV Drugs:  
• 2% to 4% of children on ARV drugs  
• Highest rates occur in children on ZDV-containing regimens  |  

---

a HIV infection itself, OIs, and medications used to prevent OIs (e.g., TMP-SMX) may all contribute to anemia and neutropenia.

**Key to Acronyms:** 3TC = lamivudine; ANC = absolute neutrophil count; ARV = antiretroviral; CBC = complete blood count; dL = deciliter; fL = femtoliter; G6PD = glucose-6-phosphate dehydrogenase; Hgb = hemoglobin; MCV = mean cell volume; NRTI = nucleoside reverse transcriptase inhibitor; OI = opportunistic infection; TMP-SMX = trimethoprim-sulfamethoxazole; ZDV = zidovudine

</thead>
</table>
| Hepatitis       | Most ARV drugs have been associated with hepatitis, but there is a strong association between hepatitis, NVP, and EFV. NVP, EFV, ABC, RAL, DTG, and MVC have been associated with hepatitis in the context of HSRs. NRTIs have been associated with lactic acidosis and hepatic steatosis, especially ZDV. | Onset:  
• Acute toxic hepatitis most commonly occurs within the first few months of therapy, but it can occur later.  
• Steatosis presents after months to years of therapy.  
• Patients with HBV coinfection may develop flare of hepatitis with the initiation or withdrawal of 3TC, FTC, TDF, or TAF. Flare may also occur with the emergence of resistance to 3TC or FTC (especially if the patient is receiving only one anti-HBV agent). Note that HBV has a high genetic barrier for resistance to TDF and TAF.  
• Hepatitis may be a manifestation of IRIS if it occurs early in therapy, especially in patients with HBV or HCV coinfection.  
Presentation:  
• Asymptomatic elevation of AST and ALT levels  
• Symptomatic hepatitis with nausea, fatigue, and jaundice  
• Hepatitis may present in the context of HSR with rash, lactic acidosis, and hepatic steatosis. | Uncommon | HBV or HCV coinfection  
Underlying liver disease  
Use of other hepatotoxic medications and supplements (e.g., St. John's wort [*Hypericum perforatum*], chaparral [*Larrea tridentata*], germander [*Teucrium chamaedrys*])  
Alcohol use  
Pregnancy  
Obesity  
Higher drug concentrations of PIs  
For NVP-Associated Hepatic Events in Adults:  
• Female sex with pre-NVP CD4 count >250 cells/mm$^3$  
• Male sex with pre-NVP CD4 count >400 cells/mm$^3$  
• Population-specific HLA types$^a$ | Prevention:  
• Avoid concomitant use of hepatotoxic medications.  
• In patients with elevated levels of hepatic enzymes (>5 times to 10 times ULN) or chronic liver disease, most clinicians would avoid NVP.  
Monitoring  
For ARV Drugs Other Than NVP:  
• Obtain AST and ALT levels at baseline and at least every 3 months–4 months thereafter;$^b$ monitor at-risk patients more frequently (e.g., those with HBV or HCV coinfection or elevated baseline AST and ALT levels).  
For NVP:  
• Obtain AST and ALT levels at baseline, at 2 weeks, 4 weeks, and then every 3 months. | Evaluate the patient for other infectious and non-infectious causes of hepatitis and monitor the patient closely.  
Asymptomatic Hepatitis:  
• Potentially offending ARV drugs should be discontinued if ALT or AST level is >5 times ULN.  
Symptomatic Hepatitis:  
• Discontinue all ARV drugs and other potentially hepatotoxic drugs.  
• If a patient experiences hepatitis that is attributed to NVP, NVP should be permanently discontinued.  
• Consider viral causes of hepatitis: HAV, HBV, HCV, EBV, and CMV. |

---

$^a$For NVP-Associated Hepatic Events in Adults:
$^b$For NVP:  
• Obtain AST and ALT levels at baseline, at 2 weeks, 4 weeks, and then every 3 months.

<tr>
<td>Insulin Resistance, Asymptomatic Hyperglycemia, DM*</td>
<td>ZDV, LPV/r, and possibly other PIs</td>
<td>Onset: • Weeks to months after beginning therapy</td>
<td>Children: • Insulin resistance, 6% to 12% (incidence is higher during puberty, 20% to 30%)</td>
<td>Lipodystrophy, Metabolic syndrome, Family history of DM, High BMI (obesity)</td>
<td>• Lifestyle modification</td>
<td>Counsel patient on lifestyle modification (e.g., implementing a diet low in saturated fat, cholesterol, trans fat, and refined sugars; increasing physical activity; ceasing smoking). Recommend that the patient consult with a dietician.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Presentation: • Asymptomatic fasting hyperglycemia (which sometimes occurs in the setting of lipodystrophy), metabolic syndrome, or growth delay</td>
<td>• Impaired fasting glucose, 0% to 7%</td>
<td></td>
<td>Monitoring: • Monitor for signs of DM, change in body habitus, and acanthosis nigricans.</td>
<td>If patient is receiving ZDV, change to TAF, TDF, or ABC.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Symptomatic DM (rare)</td>
<td>• Impaired glucose tolerance, 3% to 4%</td>
<td></td>
<td>Obtain RPG Levels at: • Initiation of ARV therapy</td>
<td>For Either RPG ≥200 mg/dL Plus Symptoms of DM or FPG ≥126 mg/dL: • Patient meets diagnostic criteria for DM; consult an endocrinologist.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>DM, 0.2 per 100 child-years</td>
<td></td>
<td>DM</td>
<td></td>
<td>FPG 100–125 mg/dL: • Impaired FPG suggests insulin resistance; consult endocrinologist.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>DM</td>
<td></td>
<td>FPG &lt;100 mg/dL: • This FPG is normal, but a normal FPG does not exclude insulin resistance. Recheck FPG in 6 months–12 months.</td>
</tr>
</tbody>
</table>

* Insulin resistance, asymptomatic hyperglycemia, and DM form a spectrum of increasing severity.

**Insulin Resistance**: Often defined as elevated insulin levels for the level of glucose observed.

**Impaired FPG**: Often defined as an FPG of 100–125 mg/dL.

**Impaired Glucose Tolerance**: Often defined as an elevated 2-hour PG of 140–199 mg/dL in a 75-g OGTT (or, if the patient weighs <43 kg, 1.75 g per kg of glucose up to a maximum of 75 g).

**Diabetes Mellitus**: Often defined as either an FPG ≥126 mg/dL, and RPG ≥200 mg/dL in a patient with hyperglycemia symptoms, an HgbA1c of ≥6.5%, or a 2-hour PG ≥200 mg/dL after an OGTT.

However, the Panel does not recommend performing routine measurements of insulin levels, HgbA1c, or glucose tolerance without consulting an endocrinologist. These guidelines are instead based on the readily available RPG and FPG levels.

**Key to Acronyms**: ABC = abacavir; ARV = antiretroviral; BMI = body mass index; dL = deciliter; DM = diabetes mellitus; FPG = fasting plasma glucose; HgbA1c = glycosylated hemoglobin; LPV/r = lopinavir/ritonavir; OGTT = oral glucose tolerance test; PG = plasma glucose; PI = protease inhibitor; RPG = random plasma glucose; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate; ZDV = zidovudine.

Table 15g. Antiretroviral Therapy-Associated Adverse Effects and Management Recommendations—Lactic Acidosis

**Guidelines for the Use of Antiretroviral Agents in Pediatric HIV Infection**

*Last updated April 16, 2019; last reviewed April 16, 2019*

<table>
<thead>
<tr>
<th>Adverse Effects</th>
<th>Associated ARVs</th>
<th>Onset/Clinical Manifestations</th>
<th>Estimated Frequency</th>
<th>Risk Factors</th>
<th>Prevention/Monitoring</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Lactic Acidosis</strong></td>
<td>NRTIs:  • ZDV  • Less likely with 3TC, FTC, ABC, TAF, and TDF</td>
<td>Lactic acidosis is associated with use of ddI and d4T. Cases are rare now that these NRTIs are no longer recommended.</td>
<td>Adults:  • Female sex  • High BMI  • Chronic HCV infection  • African-American race  • Coadministration of TDF with metformin  • Overdose of propylene glycol  • CD4 cell count &lt;350 cells/mm³  • Acquired riboflavin or thiamine deficiency  • Possibly pregnancy</td>
<td>Prevention:  • Due to the presence of propylene glycol as a diluent, LPV/r oral solution <strong>should not be used</strong> in preterm neonates or any neonate who has not attained a postmenstrual age of 42 weeks and a postnatal age of ≥14 days.  • Monitor for clinical manifestations of lactic acidosis and promptly adjust therapy.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Other Drugs:</strong></td>
<td>• See Risk Factors and Prevention/ Monitoring columns for information regarding the toxicity of propylene glycol when LPV/r oral solution is used in neonates.</td>
<td>• Generalized fatigue, weakness, and myalgias  • Vague abdominal pain, weight loss, unexplained nausea, or vomiting  • Dyspnea  • Peripheral neuropathy</td>
<td>• Measurement of serum lactate is not recommended.  • Additional diagnostic evaluations should include serum bicarbonate, anion gap, and/or arterial blood gas; amylase and lipase; serum albumin; and hepatic transaminases.</td>
<td>• Obtain blood lactate level.a  • Consider discontinuing all ARV drugs temporarily while conducting additional diagnostic workup.  • Lactate &gt;5.0 mmol/L (Confirmed With a Second Test):  • Discontinue all ARV drugs.  • Provide supportive therapy (e.g., IV fluids; some patients may require sedation and respiratory support to reduce oxygen demand and ensure adequate oxygenation of tissues).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

*a* Blood for lactate determination should be collected, without prolonged tourniquet application or fist clenching, into a pre-chilled, gray-top, fluoride-oxalate-containing tube and transported on ice to the laboratory to be processed within 4 hours of collection.

*b* Management can be initiated before receiving the results of the confirmatory test.

**Key to Acronyms:** 3TC = lamivudine; ABC = abacavir; ARV = antiretroviral; BMI = body mass index; CD4 = CD4 T lymphocyte; d4T = stavudine; ddI = didanosine; FTC = emtricitabine; HCV = hepatitis C virus; IV = intravenous; LPV/r = lopinavir/ritonavir; NRTI = nucleoside reverse transcriptase inhibitor; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate; THAM = tris (hydroxymethyl) aminomethane; ZDV = zidovudine

<th>Adverse Effects</th>
<th>Associated ARVs</th>
<th>Onset/Clinical Manifestations</th>
<th>Estimated Frequency</th>
<th>Risk Factors</th>
<th>Prevention/Monitoring</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lipodystrophy (Fat Maldistribution)</td>
<td>See below for specific associations.</td>
<td>Onset: • Trunk and limb fat are the first sign; peripheral fat wasting may not appear for 12 months–24 months after ART initiation.</td>
<td>Frequency is low (&lt;5%) with current regimens.</td>
<td>Genetic predisposition Puberty HIV-associated inflammation Older age Longer duration of ART Body habitus</td>
<td>Prevention: • Initiating a calorically appropriate, low-fat diet and exercise Monitoring: • BMI measurement • Body circumference and waist-hip ratio</td>
<td>Physicians should perform a regimen review and consider changing the regimen when lipodystrophy occurs. Improvement in fat maldistribution following a regimen change is variable. Improvement may occur after several months or years, or it may not occur at all.</td>
</tr>
</tbody>
</table>

**Central Lipohypertrophy or Lipo-accumulation** Can occur in the absence of ART, but these conditions are most often associated with the use of PIs and EFV. Presentation: • Central fat accumulation with increased abdominal girth, which may include a dorsocervical fat pad (buffalo hump). Gynecomastia in males or breast hypertrophy in females, particularly with the use of EFV. ≤5% with current regimens Obesity before initiation of therapy Sedentary lifestyle Prevention: • Initiating a calorically appropriate, low-fat diet and exercise Monitoring: • BMI measurement • Body circumference and waist-hip ratio Counsel patient on lifestyle modification and dietary interventions (e.g., maintaining a calorically appropriate, healthy diet that is low in saturated fats and simple carbohydrates, and starting an exercise regimen, especially strength training). Recommend smoking cessation (if applicable) to decrease future CVD risk. Consider using an INSTI instead of a PI or EFV. **Data are Insufficient to Allow the Panel to Safely Recommend Use of Any of the Following Modalities in Children:** • Recombinant human growth hormone • Growth hormone-releasing hormone • Metformin • Thiazolidinediones • Recombinant human leptin • Anabolic steroids • Liposuction
### Table 15h. Antiretroviral Therapy-Associated Adverse Effects and Management Recommendations—Lipodystrophy, Lipohypertrophy, Lipoatrophy

<tbody>
<tr>
<td>Facial/Peripheral Lipoatrophy</td>
<td>Most cases are associated with the use of ZDV, a thymidine analogue NRTI.</td>
<td>Presentation: • Thinning of subcutaneous fat in the face, buttocks, and extremities, measured as a decrease in trunk/limb fat by DXA or triceps skinfold thickness. Preservation of lean body mass distinguishes lipoatrophy from HIV-associated wasting.</td>
<td>&lt;5% with currently used regimens</td>
<td>Underweight before ART</td>
<td>Prevention: • Limit the use of ZDV. Monitoring: • Patient self-report and physical examination are the most sensitive methods of monitoring lipoatrophy.</td>
<td>Replace ZDV with another NRTI if possible. Data are Insufficient to Allow the Panel to Safely Recommend Use of Any of the Following Modalities in Children: • Injections of poly-L-lactic acid • Recombinant human leptin • Autologous fat transplantation • Thiazolidinediones</td>
</tr>
</tbody>
</table>

**Key to Acronyms:**
- ART = antiretroviral therapy
- ARV = antiretroviral
- BMI = body mass index
- CVD = cardiovascular disease
- DXA = dual energy x-ray absorptiometry
- EFV = efavirenz
- INSTI = integrase strand transfer inhibitor
- NRTI = nucleoside reverse transcriptase inhibitor
- PI = protease inhibitor
- ZDV = zidovudine

**Associated ARVs/Etiology**

**Management**

## Table 15i. Antiretroviral Therapy-Associated Adverse Effects and Management Recommendations—Nephrotoxic Effects  
(last updated April 16, 2019; last reviewed April 16, 2019)  

<table>
<thead>
<tr>
<th>Adverse Effects</th>
<th>Associated ARVs</th>
<th>Onset/Clinical Manifestations</th>
<th>Estimated Frequency</th>
<th>Risk Factors</th>
<th>Prevention/Monitoring</th>
<th>Management</th>
</tr>
</thead>
</table>
| Urolithiasis/Nephrolithias | ATV, DRV       | Onset:  
• Weeks to months after starting therapy  
Clinical Findings:  
• Crystalluria  
• Hematuria  
• Pyuria  
• Flank pain  
• Increased creatinine in some cases | ATV-related nephrolithiasis occurs in <10% of patients. | The risk factors in children are unknown. | Prevention:  
• Maintain adequate hydration.  
Monitoring:  
• Obtain urinalysis at least every 6 months–12 months. | Provide adequate hydration and pain control. Consider using another ARV in place of ATV. |
| Renal Dysfunction        | TDF             | Onset:  
• Variable; in adults, renal dysfunction may occur weeks to months after initiating therapy.  
• Hypophosphatemia appears at a median of 18 months.  
• Glucosuria may occur after a year of therapy.  
• Abnormal urine protein/osmolality ratio may be an early indicator.  

**Presentation**  
**More Common:**  
• Increased serum creatinine, proteinuria, normoglycemic glucosuria  
• Increased urinary protein/creatinine ratio and albumin/creatinine ratio  
• Hypophosphatemia, usually asymptomatic; may present with bone and muscle pain, or muscle weakness  

**Less Common:**  
• Renal failure, acute tubular necrosis, Fanconi syndrome, proximal renal tubulopathy, interstitial nephritis, nephrogenic diabetes insipidus with polyuria | Adults:  
• Approximately 2% experience increased serum creatinine levels.  
• Approximately 0.5% experience severe renal complications  

**Children:**  
• Approximately 4% experience hypophosphatemia or proximal tubulopathy; frequency increases with prolonged TDF therapy and advanced HIV infection.  

**Risk May Increase in Children with the Following Characteristics:**  
• Aged >6 years  
• Black race, Hispanic/Latino ethnicity  
• Advanced HIV infection  
• Hypertension  
• Diabetes  
• Concurrent use of PIs (especially LPV/r) and preexisting renal dysfunction  
• Risk increases with longer duration of TDF treatment. | Monitor urine protein, urine glucose and serum creatinine at 3-month to 6-month intervals. For patients taking TDF, some Panel members routinely monitor serum phosphate levels.  
Measure serum phosphate if the patient experiences persistent proteinuria or glucosuria, or has symptoms of bone pain, muscle pain, or weakness.  
Because toxicity risk increases with the duration of TDF treatment, do not decrease the frequency of monitoring over time. | If TDF is the likely cause, consider using an alternative ARV drug. TAF has significantly less toxicity than TDF. |
Table 15i. Antiretroviral Therapy-Associated Adverse Effects and Management Recommendations—Nephrotoxic Effects
(Last updated April 16, 2019; last reviewed April 16, 2019) (page 2 of 2)

### Table 15j. Antiretroviral Therapy-Associated Adverse Effects and Management Recommendations—Osteopenia and Osteoporosis *(Last updated April 16, 2019; last reviewed April 16, 2019)*

<table>
<thead>
<tr>
<th>Adverse Effects</th>
<th>Associated ARVs</th>
<th>Onset/Clinical Manifestations</th>
<th>Estimated Frequency</th>
<th>Risk Factors</th>
<th>Prevention/Monitoring</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Osteopenia and Osteoporosis</td>
<td>Any ART regimen</td>
<td>Onset: Any age; decrease in BMD is usually seen soon after initiation of ART. Presentation: Usually asymptomatic. Rarely presents as osteoporosis, a clinical diagnosis defined by evidence of bone fragility (e.g., fracture with minimal trauma)</td>
<td>BMD z Score Less Than -2.0: Formation of bone mineral density (BMD) less than -2.0 standard deviations from the mean.</td>
<td>Longer duration and greater severity of HIV disease, Vitamin D insufficiency/deficiency, Delayed growth or pubertal delay, Low BMI, Lipodystrophy, Non-black race, Smoking, Prolonged systemic corticosteroid use, Medroxyprogesterone use, Lack of weight-bearing exercise</td>
<td>Prevention: Ensure that the patient has sufficient intake and levels of both calcium and vitamin D. Encourage weight-bearing exercise. Minimize modifiable risk factors (e.g., smoking, low BMI, use of steroids or medroxyprogesterone). Use TAF instead of TDF whenever possible. Use TDF with EFV or an unboosted INSTI. When using TDF in a regimen, consider supplementing with vitamin D3 at a daily dose of 1,000–4,000 IU. Monitoring: Assess nutritional intake (calcium, vitamin D, and total calories). Strongly consider measuring serum 25-OH-vitamin D levels, particularly in patients who are taking ARV drugs of concern. Obtain a DXA.</td>
<td>Same options as for prevention. Consider changing the ARV regimen (e.g., switching from TDF to TAF, and/or from LPV/r to EFV or an un-boosted INSTI whenever possible). Treat patient with vitamin D3 to raise serum 25-OH-vitamin D concentrations to &gt;30 ng/mL. Vitamin D3 levels should be monitored in patients who are receiving a daily dose of vitamin D3 &gt;4,000 IU. The role of bisphosphonates in managing osteopenia and osteoporosis in children with HIV has not been established.</td>
</tr>
</tbody>
</table>

---

* Some experts periodically measure 25-OH-vitamin D. This is especially important in children and adolescents with HIV who live in urban areas; the prevalence of vitamin D insufficiency is high in that population.

* Until more data are available on the long-term effects of TDF on bone mineral acquisition in childhood, DXA scanning is not usually recommended for children who are being treated with TDF. Obtaining a DXA could be considered for adolescent women who are receiving TDF and medroxyprogesterone and for children with indications that are not uniquely related to HIV infection (such as cerebral palsy).

**Key to Acronyms:** ART = antiretroviral therapy; ARV = antiretroviral; BMD = bone mineral density; BMI = body mass index; COBI = cobicistat; DXA = dual-energy x-ray absorptiometry; EFV = efavirenz; INSTI = integrase strand transfer inhibitor; IU = international unit; LPV/r = lopinavir/ritonavir; PI = protease inhibitor; RTV = ritonavir; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate

### Table 15k. Antiretroviral Therapy-Associated Adverse Effects and Management Recommendations—Rash and Hypersensitivity Reactions  
(last updated April 16, 2019; last reviewed April 16, 2019)  
(page 1 of 4)

<table>
<thead>
<tr>
<th>Adverse Effects</th>
<th>Associated ARVs</th>
<th>Onset/Clinical Manifestations</th>
<th>Estimated Frequency</th>
<th>Risk Factors</th>
<th>Prevention/ Monitoring</th>
<th>Management</th>
</tr>
</thead>
</table>
| **Rash**        | Any ARV drug can cause rash | Onset:  
• First few days to weeks after starting new ARV drug(s)  
Presentation:  
• Most rashes are mild-to-moderate, diffuse maculopapular eruptions. | Common (>10%):  
• EFV  
• ETR  
• FTC  
• NVP  
Less Common (5% to 10%):  
• ABC  
• ATV  
• DRV  
• TDF  
Unusual (2% to 4%):  
• LPV/r  
• MVC  
• RAL  
• RPV  | Sulfonamide allergy is a risk factor for rash in patients who are taking PIs that contain a sulfonamide moiety (e.g., DRV). Polymorphisms in CYP2B6 and multiple HLA loci may confer an increased risk of rash in patients who are taking NVP. | When Starting NVP or Restarting After Interruptions of >14 Days:  
• Utilize once-daily lead-in dosing.  
This may not be necessary in children aged <2 years.  
• Avoid the use of systemic corticosteroids during NVP dose escalation.  
• Assess patient for rash severity, mucosal involvement, and other signs of systemic reaction. | Mild-to-Moderate Maculopapular Rash Without Systemic or Mucosal Involvement:  
• Most rashes will resolve without intervention; ARV drugs can be continued while monitoring.  
• Antihistamines may provide some relief.  
Severe Rash and/or Rash Accompanied by Systemic Symptoms:  
• Manage as SJS/TEN/EM major, DRESS, or HSR as applicable (see below).  
Rash in Patients Receiving NVP:  
• Given the elevated risk of HSR, measure hepatic transaminases.  
• If hepatic transaminases are elevated, NVP should be discontinued and not restarted (see the HSR section below). |
| **SJS/TEN/EM Major** | Many ARV drugs, especially NNRTIs (see the Estimated Frequency column) | Onset:  
• First few days to weeks after starting new ARV drug(s)  
Presentation:  
• Initial rash may be mild, but it often becomes painful, evolving to blister/bulla formation with necrosis in severe cases. Usually involves mucous membrane ulceration and/or conjunctivitis. Systemic symptoms may also include fever, tachycardia, malaise, myalgia, and arthralgia. | Infrequent:  
• NVP (0.3%)  
• EFV (0.1%)  
• ETR (<0.1%)  
Case Reports:  
• ABC  
• ATV  
• DRV  
• LPV/r  
• RAL  
• ZDV  | Adults:  
• Female sex  
• Patients who are black, Asian, or Hispanic are at higher risk.  
| When Starting NVP or Restarting After Interruptions of >14 Days:  
• Utilize once-daily lead-in dosing.  
This may not be necessary in children aged <2 years.  
• Counsel families to report symptoms as soon as they appear. | Discontinue all ARV drugs and other possible causative agents (e.g., TMP-SMX).  
Provide intensive supportive including care, IV hydration, aggressive wound care, eye care, labial adhesion preventative care, pain management, and antipyretics. Parenteral nutrition and antibiotics may also be necessary.  
Corticosteroids and/or IVIG are sometimes used, but the use of these interventions is controversial.  
Do not reintroduce the offending medication.  
When SJS/TEN/EM major occurs with the use of one NNRTI, many experts would avoid the use of other NNRTIs. |
<table>
<thead>
<tr>
<th>Adverse Effects</th>
<th>Associated ARVs</th>
<th>Onset/Clinical Manifestations</th>
<th>Estimated Frequency</th>
<th>Risk Factors</th>
<th>Prevention/Monitoring</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>DRESS</td>
<td>DRV, DTG, EFV, ETR, NVP, RAL, RPV</td>
<td>Onset: 1–8 weeks after starting new ARV drug(s) Presentation: • Fever • Lymphadenopathy • Facial swelling • Morbilliform to polymorphous rash • Peripheral eosinophilia • Atypical circulating lymphocytes • Internal organ involvement (particularly the liver and/or kidneys)</td>
<td>Rare</td>
<td>Unknown</td>
<td>Obtain a CBC and AST, ALT, and creatinine levels from a patient who presents with suggestive symptoms. Discontinue all ARV drugs and other possible causative agents (e.g., TMP-SMX). The role of systemic steroids in treatment unclear; consultation with a specialist is recommended. Provide supportive care for end-organ disease. <strong>Do not reintroduce</strong> the offending medication.</td>
<td></td>
</tr>
<tr>
<td>HSR</td>
<td>ABC With or without skin involvement and excluding SJS/TEN</td>
<td>Onset With First Use: • Within first 6 weeks With Reintroduction: • Within hours Presentation: • Symptoms include high fever, diffuse skin rash, malaise, nausea, headache, myalgia, arthralgia, diarrhea, vomiting, abdominal pain, pharyngitis, and respiratory symptoms (e.g., dyspnea). • With continuation of ABC, symptoms may progress to hypotension and vascular collapse. With rechallenge, symptoms can mimic anaphylaxis.</td>
<td>≤1% to 9% (varies by ethnicity)</td>
<td>HLA-B<em>5701 (HSR is very uncommon in people who are HLA-B</em>5701 negative). The risk of HSR is higher in patients who are white compared to patients who are black or East Asian.</td>
<td>Screen for HLA-B<em>5701. **ABC should not be prescribed if HLA-B</em>5701 is present.** The medical record should clearly indicate that ABC is <strong>contraindicated.</strong> When starting ABC, counsel patients and families about the signs and symptoms of HSR to ensure prompt reporting of reactions. Discontinue ARV drugs and investigate other causes of the symptoms (e.g., a concurrent viral illness). Provide symptomatic treatment. Most symptoms resolve within 48 hours after discontinuing ABC. <strong>Do not rechallenge</strong> with ABC even if the patient is HLA-B*5701 negative.</td>
<td></td>

</table>

* The prescribing information for NVP states that patients who experience rash during the 14-day lead-in period should not have the NVP dose increased until the rash has resolved. However, prolonging the lead-in phase beyond 14 days may increase the risk of NVP resistance because of subtherapeutic drug levels. Children who have persistent mild or moderate rash after the lead-in period should receive individualized care. Consult an expert in HIV care when managing these patients. **NVP should be stopped and not restarted** if the rash is severe or progressing. See the NVP section of the Drug Appendix.

* Lead-in dosing is not recommended when using nevirapine for either empiric or definitive HIV therapy in newborns with perinatal HIV exposure or perinatal HIV. See the NVP section of the Drug Appendix and Table 12.

**Key to Acronyms:** ABC = abacavir; ALT = alanine transaminase; ARV = antiretroviral; AST = aspartate aminotransferase; ATV = atazanavir; CBC = complete blood count; CD4 = CD4 T lymphocyte; CYP = cytochrome P450; DRESS = drug reaction (or rash) with eosinophilia and systemic symptoms; DRV = darunavir; DTG = dolutegravir; EFV = efavirenz; EM = erythema multiforme; ETR = etravirine; FTC = emtricitabine; HLA = human leukocyte antigen; HSR = hypersensitivity reaction; IV = intravenous; IVIG = intravenous immune globulin; LPV/r = lopinavir/ritonavir; MVC = maraviroc; NNRTI = non-nucleoside reverse transcriptase inhibitor; NVP = nevirapine; PEP = post-exposure prophylaxis; PI = protease inhibitor; RAL = raltegravir; RPV = rilpivirine; SJS = Stevens-Johnson syndrome; TDF = tenofovir disoproxil fumarate; TEN = toxic epidermal necrolysis; TMP-SMX = trimethoprim-sulfamethoxazole; ZDV = zidovudine

---

<sup>a</sup> For infants and young children who are being treated with liquid formulations of ABC, initiation with once-daily ABC is not generally recommended. In clinically stable patients with undetectable viral loads who have had stable CD4 T lymphocyte cell counts for >6 months (24 weeks) on twice-daily ABC, the dose can be changed from twice daily to once daily.

<sup>b</sup> d4T and ddI should be replaced with a safer drug as soon as possible because of concerns about long-term adverse effects (see Archived Drugs in Appendix A: Pediatric Antiretroviral Drug Information).

<sup>c</sup> For children and adolescents weighing 25 kg to <35 kg, TAF can be used in combination with an INSTI or an NNRTI, but not a boosted PI. For children and adolescents weighing ≥35 kg, TAF can be used in combination with an INSTI, NNRTI, or a boosted PI.

<sup>d</sup> RAL is recommended for twice-daily use in children. Chewable tablets can be used in children weighing ≥11 kg. RAL HD once daily is only recommended for virologically suppressed children weighing ≥50 kg.

<sup>e</sup> Because of recent concerns about the potential for neural tube defects in infants born to women who conceived while taking regimens that contained dolutegravir, this drug should be prescribed with caution in female adolescents. Specific recommendations about the initiation and use of DTG in women of childbearing potential and in pregnant women are available in the Adult and Adolescent Antiretroviral Guidelines (see Table 6b and Adolescents and Young Adults with HIV) and in the Perinatal Guidelines (see Teratogenicity and Recommendations for the Use of Antiretroviral Drugs in Pregnancy).

<sup>f</sup> Biktarvy has not been approved by the FDA for use in patients aged <18 years, but it is being studied in children and adolescents aged ≥6 years to 18 years. Consultation with a pediatric HIV expert prior to using Biktarvy in children is recommended.<sup>32,33</sup>

<tr>
<td></td>
<td>INSTI plus or minus RTV-boosted PI plus or minus (ETR or RPV) plus or minus NRTI(s) (if there is minimal NRTI activity). Consider adding T-20 and/or MVC if additional active drug(s) are needed.</td>
</tr>
</tbody>
</table>

Clinicians should evaluate a patient’s treatment history and drug-resistance test results when choosing an ART regimen in order to optimize ARV drug effectiveness. This is particularly important in selecting the NRTI components of an NNRTI-based regimen, where drug resistance to the NNRTI can occur rapidly if the virus is not sufficiently sensitive to the NRTIs. Regimens should contain at least two, but preferably three, fully active drugs for durable and potent virologic suppression. If the M184V/I mutation associated with FTC and 3TC is present, these medications should be continued if the new regimen contains TDF, TAF, or ZDV as the presence of this mutation may increase susceptibility to these NRTIs. Please see individual drug profiles for information about age limitations (e.g., do not use DRV in children aged <3 years), drug interactions, and dose adjustments when devising a regimen for children with multiclass drug resistance. Collaboration with a pediatric HIV specialist is especially important when choosing regimens for children with multiclass drug resistance. Regimens in this table are provided as examples, but the list is not exhaustive.

Because of recent concerns about the potential for neural tube defects in infants born to women who conceived while taking regimens that contained dolutegravir, this drug should be prescribed with caution in female adolescents. Specific recommendations about the initiation and use of dolutegravir in women of childbearing potential and in pregnant women are available in the Adult and Adolescent Antiretroviral Guidelines (see Adolescents and Young Adults with HIV and Management of the Treatment-Experienced Patient) and in the Perinatal Guidelines (see Teratogenicity and Recommendations for Use of Antiretroviral Drugs During Pregnancy).

Key to Acronyms: 3TC = lamivudine; ART = antiretroviral therapy; ARV = antiretroviral; DRV = darunavir; DTG = dolutegravir; ETR = etravirine; FTC = emtricitabine; INSTI = integrase strand transfer inhibitor; MVC = maraviroc; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside reverse transcriptase inhibitor; PI = protease inhibitor; RPV = rilpivirine; RTV = ritonavir; T-20 = enfuvirtide; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate; ZDV = zidovudine

Key to Acronyms: 3TC = lamivudine; ABC = abacavir; ARV = antiretroviral; ATV = atazanavir; BIC = bictegravir; COBI = cobicistat; DOR = doravirine; DRV = darunavir; DTG = dolutegravir; EFV = efavirenz; EVG = elvitegravir; FDA = Food and Drug Administration; FDC = fixed-dose combination; FTC = emtricitabine; HBV = hepatitis B virus; LPV = lopinavir; LPV/r = lopinavir; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside and nucleotide reverse transcriptase inhibitor; PI = protease inhibitor; PK = pharmacokinetic; RPV = rilpivirine; RTV = ritonavir; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate; ZDV = zidovudine
### General Considerations When Considering an FDC Tablet:

- **ABC and TAF** are favored over **ZDV** because of lower risk of NRTI-associated mitochondrial toxicity.
- **TDF** is more potent than **ABC** at high viral loads when used in regimens that do not contain an INSTI.
- **TAF** is favored over **TDF** because of the lower risk of TDF-associated bone and renal toxicity.
- **TDF** is generally **not recommended** for children with SMR 1–3 because of TDF-associated bone toxicity; however, for a child weighing <25 kg who can swallow pills, Truvada (FTC/TDF) low-strength tablets offer a reasonable, once daily combination alternative to twice daily ZDV plus 3TC or an alternative to **ABC**.
- **RPV** has low potency at high viral loads, a low barrier to resistance, and requires a high fat meal for optimal absorption, so **EFV** or an INSTI are favored.
- **BIC** and **DTG**, second-generation INSTIs, have a higher barrier to resistance than **EVG** and **RAL**, first-generation INSTIs.
- For images of most of the FDCs listed in this table, see the Antiretroviral Medications section of the [National HIV Curriculum](https://www.cdc.gov/hiv/pdf/guidelines/applications/national_hiv_curriculum.pdf). In addition, a [resource from the United Kingdom](https://www.gov.uk/government/publications/antiretroviral-tablet-sizes) illustrates the relative sizes of FDCs and individual ARVs (see the [Intro ARV Chart](https://aidsinfo.nih.gov/guidelines)). Although most of the drugs listed in that chart are the same as those in the United States, a few of the brand names are not the same as those listed in Appendix A, Table 2 below.
- **FDCs and individual ARVs** can also be looked up by drug (brand name and generic) at [DailyMed](https://dailymed.nlm.nih.gov/dailymed/); size is listed under Ingredients and Appearance in the Product Characteristics section.

#### INSTI FDC Dosing for Children and Adolescents:

- **Elvitegravir**:
  - Genvoya (EVG/COBI/FTC/TAF) is FDA approved for children and adolescents weighing ≥25 kg.

- **Dolutegravir**:
  - The Panel recommends DTG 50 mg for children weighing ≥25 kg, see the [dolutegravir section](https://aidsinfo.nih.gov/guidelines). The FDA-approved dose is DTG 35 mg for patients weighing ≥30 kg to 40 kg, and DTG 50 mg for patients weighing ≥40 kg.
  - DTG 50 mg can be given as Triumeq (ABC/DTG/3TC) in 1 large pill or as [Descovy (FTC/TAF)](https://aidsinfo.nih.gov/guidelines) plus DTG which requires 2 small pills.
  - Recent data identified a possible increased risk of NTDs among women who were receiving DTG at the time of conception. Specific recommendations about the initiation and use of DTG in adolescents and women of childbearing potential and in pregnant women are available in the Adult and Adolescent Antiretroviral Guidelines (See Table 6b and [Adolescents and Young Adults with HIV](https://aidsinfo.nih.gov/guidelines)) and in the Perinatal Guidelines (see [Teratogenicity](https://aidsinfo.nih.gov/guidelines) and [Recommendations for the Use of Antiretroviral Drugs in Pregnancy](https://aidsinfo.nih.gov/guidelines)).
Appendix A, Table 2. Antiretroviral Fixed-Dose Combination Tablets: Minimum Body Weights and Considerations for Use in Children and Adolescents (page 2 of 3)

- **Bictegravir:**
  - Biktarvy (BIC/FTC/TAF) has been studied in children and adolescents aged ≥6 years and weighing ≥25 kg but is not FDA approved for use in patients aged <18 years.

³ Size or largest dimension of generic drugs are not listed because they may vary by manufacturer; this information is available by looking up one of the drug components using DailyMed.

¹ Minimum body weight and age are those recommended by the FDA unless otherwise noted.

² Based on the current FDA-approved minimum body weights for Trizivir component drugs, the Panel suggests Trizivir may be used at a minimum body weight of ≥30 kg, although it is FDA approved for use in children and adolescents ≥40 kg. However, the Panel does not recommend regimens containing NRTI’s only, or 3-NRTI regimens, for use in children.

³ Due to pharmacokinetic concerns, the Panel recommends caution when using Symfi Lo in children and adolescents who have a SMR 1-3 and weigh ≥40 kg, see the efavirenz section.

The Panel recommends using DTG 50 mg for children and adolescents weighing ≥25 kg based on available data, see the dolutegravir section.

Key to Abbreviations: 3TC = lamivudine; ABC = abacavir; ATV = atazanavir; ARV = antiretroviral; BIC = bictegravir; COBI = cobicistat; DRV = darunavir; DTG = dolutegravir; DOR = doravirine; EFV = efavirenz; EVG = elvitegravir; FDA = Food and Drug Administration; FDC = fixed-dose combination; FTC = emtricitabine; INSTI = integrase inhibitor; LPV = lopinavir; LPV/r = lopinavir/ritonavir; mm = millimetre; N/A = information not available; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside and nucleotide reverse transcriptase inhibitor; RPV = rilpivirine; RTV = ritonavir; SMR = sexual maturity rating; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate; ZDV = zidovudine
