Table 2. Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy) (page 1 of 22) (Last updated May 29, 2018; last reviewed May 29, 2018)

<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Pneumocystis</em> Pneumonia (PCP)</td>
<td>Patients who develop PCP despite TMP-SMX prophylaxis can usually be treated with standard doses of TMP-SMX (BIII).</td>
<td>For Moderate-to-Severe PCP: • Pentamidine 4 mg/kg IV daily infused over &gt; 60 minutes (AI); can reduce dose to 3 mg/kg IV daily because of toxicities (BII), or • Primaquine 30 mg (base) PO daily + (clindamycin 600 mg q6h IV or 900 mg q8h) or (clindamycin 450 mg PO q6h or 600 mg PO q8h) (AI)</td>
<td>Indications for Adjunctive Corticosteroids (AI): • PaO₂ &lt; 70 mmHg at room air, or • Alveolar-arterial O₂ gradient &gt; 35 mm Hg</td>
</tr>
<tr>
<td></td>
<td>Duration of PCP treatment: 21 days (AI)</td>
<td>For Mild-to-Moderate PCP: • Dapsone 100 mg PO daily + TMP 5 mg/kg PO TID (BII), or • Primaquine 30 mg (base) PO daily + (clindamycin 450 mg PO q6h or 600 mg PO q8h) (BII), or • Atovaquone 750 mg PO BID with food (BII)</td>
<td>Prednisone Doses (Beginning as Early as Possible and Within 72 Hours of PCP Therapy) (AI): • Days 1–5: 40 mg PO BID • Days 6–10: 40 mg PO daily • Days 11–21: 20 mg PO daily IV methylprednisolone can be administered as 75% of prednisone dose.</td>
</tr>
<tr>
<td></td>
<td>For Moderate-to-Severe PCP: • TMP-SMX: (160 mg/800 mg or DS) 2 tablets PO TID (AI)</td>
<td>Secondary Prophylaxis, after completion of PCP treatment: • TMP-SMX DS: 1 tablet PO daily (AI), or • TMP-SMX (80 mg/400 mg or SS): 1 tablet PO daily (AI)</td>
<td>Benefit of corticosteroid if started after 72 hours of treatment is unknown, but some clinicians will use it for moderate-to-severe PCP (BIII).</td>
</tr>
<tr>
<td></td>
<td>For Mild-to-Moderate PCP: • TMP-SMX: (TMP 15–20 mg and SMX 75–100 mg)/kg/day IV given q6h or q8h (AI), may switch to PO after clinical improvement (AI)</td>
<td>Secondary Prophylaxis, after completion of PCP treatment: • TMP-SMX DS: 1 tablet PO three times weekly (BII), or • Dapsone 100 mg PO daily (BII), or • Dapsone 50 mg PO daily + (pyrimethamine³ 50 mg + leucovorin 25 mg) PO weekly (BII), or • (Dapsone 200 mg + pyrimethamine³ 75 mg + leucovorin 25 mg) PO weekly (BII), or • Aerosolized pentamidine 300 mg monthly via Respigrad II™ nebulizer (BII), or • Atovaquone 1500 mg PO daily (BII), or • (Atovaquone 1500 mg + pyrimethamine³ 25 mg + leucovorin 10 mg) PO daily (CIII)</td>
<td>Whenever possible, patients should be tested for G6PD before use of dapsone or primaquine. Alternative therapy should be used in patients found to have G6PD deficiency.</td>
</tr>
<tr>
<td></td>
<td>Secondary Prophylaxis, after completion of PCP treatment: • TMP-SMX DS: 1 tablet PO three times weekly (BII), or • Dapsone 100 mg PO daily (BII), or • Dapsone 50 mg PO daily + (pyrimethamine³ 50 mg + leucovorin 25 mg) PO weekly (BII), or • (Dapsone 200 mg + pyrimethamine³ 75 mg + leucovorin 25 mg) PO weekly (BII), or • Aerosolized pentamidine 300 mg monthly via Respigrad II™ nebulizer (BII), or • Atovaquone 1500 mg PO daily (BII), or • (Atovaquone 1500 mg + pyrimethamine³ 25 mg + leucovorin 10 mg) PO daily (CIII)</td>
<td>Indications for Adjunctive Corticosteroids (AI): • PaO₂ &lt; 70 mmHg at room air, or • Alveolar-arterial O₂ gradient &gt; 35 mm Hg</td>
<td>Benefit of corticosteroid if started after 72 hours of treatment is unknown, but some clinicians will use it for moderate-to-severe PCP (BIII).</td>
</tr>
<tr>
<td></td>
<td>Indications for Adjunctive Corticosteroids (AI): • PaO₂ &lt; 70 mmHg at room air, or • Alveolar-arterial O₂ gradient &gt; 35 mm Hg</td>
<td>Prednisone Doses (Beginning as Early as Possible and Within 72 Hours of PCP Therapy) (AI): • Days 1–5: 40 mg PO BID • Days 6–10: 40 mg PO daily • Days 11–21: 20 mg PO daily IV methylprednisolone can be administered as 75% of prednisone dose.</td>
<td>Benefit of corticosteroid if started after 72 hours of treatment is unknown, but some clinicians will use it for moderate-to-severe PCP (BIII).</td>
</tr>
<tr>
<td></td>
<td>Whenever possible, patients should be tested for G6PD before use of dapsone or primaquine. Alternative therapy should be used in patients found to have G6PD deficiency.</td>
<td>Patients who are receiving pyrimethamine/sulfadiazine for treatment or suppression of toxoplasmosis do not require additional PCP prophylaxis (AII).</td>
<td>If TMP-SMX is discontinued because of a mild adverse reaction, re-institution should be considered after the reaction resolves (AII). The dose can be increased gradually (desensitization) (BII), reduced, or the frequency modified (CIII).</td>
</tr>
<tr>
<td></td>
<td>Patients who are receiving pyrimethamine/sulfadiazine for treatment or suppression of toxoplasmosis do not require additional PCP prophylaxis (AII).</td>
<td>TMP-SMX should be permanently discontinued in patients with possible or definite Stevens-Johnson Syndrome or toxic epidermal necrosis (AII).</td>
<td>If TMP-SMX is discontinued because of a mild adverse reaction, re-institution should be considered after the reaction resolves (AII). The dose can be increased gradually (desensitization) (BII), reduced, or the frequency modified (CIII).</td>

Downloaded from https://aidsinfo.nih.gov/guidelines on 11/3/2018
Table 2. Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy) (page 2 of 22)

<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Toxoplasma gondii Encephalitis</td>
<td>Treatment of Acute Infection (AI): • Pyrimethamine(^a) 200 mg PO 1 time, followed by weight-based therapy: • If &lt;60 kg, pyrimethamine(^a) 50 mg PO once daily + sulfadiazine 1000 mg PO q6h + leucovorin 10–25 mg PO once daily • If ≥60 kg, pyrimethamine(^a) 75 mg PO once daily + sulfadiazine 1500 mg PO q6h + leucovorin 10–25 mg PO once daily • Leucovorin dose can be increased to 50 mg daily or BID.</td>
<td>Treatment of Acute Infection: • Pyrimethamine(^a) (leucovorin)(^<em>) + clindamycin 600 mg IV or PO q6h (AI), or • TMP-SMX (TMP 5 mg/kg and SMX 25 mg/kg) IV or PO BID (BI), or • Atovaquone 1500 mg PO BID with food + pyrimethamine(^a) (leucovorin)(^</em>) (BII), or • Atovaquone 1500 mg PO BID with food + sulfadiazine 1000–1500 mg PO q6h (weight-based dosing, as in preferred therapy) (BII), or • Atovaquone 1500 mg PO BID with food (BII) Chronic Maintenance Therapy: • Clindamycin 600 mg PO q8h + (pyrimethamine(^a) 25–50 mg + leucovorin 10–25 mg) PO daily (BI), or • TMP-SMX DS 1 tablet BID (BII), or • TMP-SMX DS 1 tablet once daily (BII); or • Atovaquone 750–1500 mg PO BID with food (BII) * Pyrimethamine(^a) and leucovorin doses are the same as for preferred therapy.</td>
<td>Refer to <a href="http://www.daraprimdirect.com">http://www.daraprimdirect.com</a> for information regarding how to access pyrimethamine. If pyrimethamine is unavailable or there is a delay in obtaining it, TMP-SMX should be utilized in place of pyrimethamine-sulfadiazine (BI). For patients with a history of sulfa allergy, sulfa desensitization should be attempted using one of several published strategies (BI). Atovaquone should be administered until therapeutic doses of TMP-SMX are achieved (CIII). Adjunctive corticosteroids (e.g., dexamethasone) should only be administered when clinically indicated to treat mass effect associated with focal lesions or associated edema (BIII); discontinue as soon as clinically feasible. Anticonvulsants should be administered to patients with a history of seizures (AIII) and continued through acute treatment, but should not be used as seizure prophylaxis (AIII). If clindamycin is used in place of sulfadiazine, additional therapy must be added to prevent PCP (AII).</td>
</tr>
<tr>
<td></td>
<td>Duration for Acute Therapy: • At least 6 weeks (BII); longer duration if clinical or radiologic disease is extensive or response is incomplete at 6 weeks • After completion of acute therapy, all patients should be initiated on chronic maintenance therapy</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Chronic Maintenance Therapy: • Pyrimethamine(^a) 25–50 mg PO daily + sulfadiazine 2000–4000 mg PO daily (in 2–4 divided doses) + leucovorin 10–25 mg PO daily (AI)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Cryptosporidiosis</td>
<td>• Initiate or optimize ART for immune restoration to CD4 count &gt;100 cells/µL (AII), and • Aggressive oral or IV rehydration and replacement of electrolyte loss (AIII), and • Symptomatic treatment of diarrhea with anti-motility agents (AIII).</td>
<td>No therapy has been shown to be effective without ART. Trial of these agents may be used in conjunction with, but not instead of, ART: • Nitazoxanide 500–1000 mg PO BID for 14 days (CIII), or • Paromomycin 500 mg PO QID for 14–21 days (CIII) • With optimized ART, symptomatic treatment and rehydration and electrolyte replacement</td>
<td>Tincture of opium may be more effective than loperamide in management of diarrhea (CII).</td>
</tr>
</tbody>
</table>

<tbody>
<tr>
<td>Microsporidiosis</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>For GI Infections Caused by <em>Enterocytozoon bienueyi</em></td>
<td>• Initiate or optimize ART as immune restoration to CD4 count &gt;100 cells/µL (AII); plus &lt;br&gt;• Manage severe dehydration, malnutrition, and wasting by fluid support (AII) and nutritional supplement (AIII)</td>
<td>• Fumagillin 60 mg/day (BII) and TNP-470 (a synthetic analog of fumagillin) (BIII) may be effective, but neither is available in the United States.</td>
<td>Anti-motility agents can be used for diarrhea control if required (BIII).</td>
</tr>
<tr>
<td>For Intestinal and Disseminated (Not Ocular) Infections Caused by Microsporidia Other Than <em>E. bienueyi</em> and <em>Vittaforma corneae</em></td>
<td>• Albendazole 400 mg PO BID (AII), continue until CD4 count &gt;200 cells/µL for &gt;6 months after initiation of ART (BIII)</td>
<td>• Nitazoxanide (1000 mg BID) may have some effect but response may be minimal in patients with low CD4 cell counts (CIII).</td>
<td></td>
</tr>
<tr>
<td>For Ocular Infection:</td>
<td>• Topical fumagillin bicyclohexylammonium (Fumidil B) eye drops: 3 mg/mL in saline (fumagillin 70 µg/mL)—2 drops q2h for 4 days, then 2 drops QID (investigational use only in United States) (BII) + albendazole 400 mg PO BID, for management of systemic infection (BIII)</td>
<td>• Itraconazole 400 mg PO daily + albendazole 400 mg PO BID (CIII)</td>
<td></td>
</tr>
<tr>
<td>Anti-motility agents can be used for diarrhea control if required (BIII).</td>

</tr>
<tr>
<td>--------------------------</td>
<td>-------------------</td>
<td>---------------------</td>
<td>---------------</td>
</tr>
<tr>
<td><em>Mycobacterium tuberculosis</em> (TB) Disease</td>
<td>After collecting specimen for culture and molecular diagnostic tests, empiric TB treatment should be started in individuals with clinical and radiographic presentation suggestive of TB (AIII). Refer to Table 3 for dosing recommendations.</td>
<td>Treatment for Drug-Resistant TB Resistant to INH: • (RIF or RFB) + EMB + PZA + (moxifloxacin or levofloxacin) for 2 months (BII); followed by (RIF or RFB) + EMB + (moxifloxacin or levofloxacin) for 7 months (BII)</td>
<td>Adjunctive corticosteroid improves survival for TB meningitis and pericarditis (AI). See text for drug, dose, and duration recommendations.</td>
</tr>
<tr>
<td></td>
<td>Initial Phase (2 Months, Given Daily, 5–7 Times/Week by DOT) (AI): • INH + [RIF or RFB] + PZA + EMB (AI), Continuation Phase: • INH + (RIF or RFB) daily (5–7 times/week) (AIII)</td>
<td>Resistant to Rifamycins +/- Other Drugs: • Regimen and duration of treatment should be individualized based on resistance pattern, clinical and microbiological responses, and in close consultation with experienced specialists (AIII).</td>
<td>All rifamycins may have significant pharmacokinetic interactions with antiretroviral drugs, please refer to the Drug Interactions section in the Adult and Adolescent ARV Guidelines for dosing recommendations.</td>
</tr>
<tr>
<td></td>
<td>Total Duration of Therapy (For Drug-Susceptible TB): • Pulmonary drug-susceptible TB: 6 months (BII) • Pulmonary TB and culture-positive after 2 months of TB treatment: 9 months (BII) • Extra-pulmonary TB w/CNS infection: 9–12 months (BII); • Extra-pulmonary TB w/bone or joint involvement: 6 to 9 months (BII); • Extra-pulmonary TB in other sites: 6 months (BII) Total duration of therapy should be based on number of doses received, not on calendar time</td>
<td></td>
<td>Therapeutic drug monitoring should be considered in patients receiving rifamycin and interacting ART.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Paradoxical IRIS that is not severe can be treated with NSAIDs without a change in TB or HIV therapy (BIII). For severe IRIS reaction, consider prednisone and taper over 4 weeks based on clinical symptoms (BIII). For example: • If receiving RIF: prednisone 1.5 mg/kg/day for 2 weeks, then 0.75 mg/kg/day for 2 weeks • If receiving RFB: prednisone 1.0 mg/kg/day for 2 weeks, then 0.5 mg/kg/day for 2 weeks A more gradual tapering schedule over a few months may be necessary for some patients.</td>
</tr>
</tbody>
</table>
### Table 2. Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy) (page 5 of 22)

<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| **Disseminated Mycobacterium avium Complex (MAC) Disease** | At Least 2 Drugs as Initial Therapy With:  
- Clarithromycin 500 mg PO BID (AI) + ethambutol 15 mg/kg PO daily (AI), or  
- (Azithromycin 500–600 mg + ethambutol 15 mg/kg) PO daily (AI) if drug interaction or intolerance precludes the use of clarithromycin  
Duration:  
- At least 12 months of therapy, can discontinue if no signs and symptoms of MAC disease and sustained (>6 months) CD4 count >100 cells/µL in response to ART | Addition of a third or fourth drug should be considered for patients with advanced immunosuppression (CD4 counts <50 cells/µL), high mycobacterial loads (>2 log CFU/mL of blood), or in the absence of effective ART (CII).  
Third or Fourth Drug Options May Include:  
- RFB 300 mg PO daily (dosage adjustment may be necessary based on drug interactions) (CII),  
- Amikacin 10–15 mg/kg IV daily (CII) or Streptomyacin 1 g IV or IM daily (CII), or  
- Moxifloxacin 400 mg PO daily (CII) or Levofloxacin 500 mg PO daily (CII) | Testing of susceptibility to clarithromycin and azithromycin is recommended (BII).  
NSAIDs can be used for patients who experience moderate to severe symptoms attributed to IRIS (CII).  
If IRIS symptoms persist, short-term (4–8 weeks) systemic corticosteroids (equivalent to 20–40 mg prednisone) can be used (CII). |

**Bacterial Respiratory Diseases (with focus on pneumonia)**

| Empiric Outpatient Therapy:  
- A PO beta-lactam + a PO macrolide (azithromycin or clarithromycin) (AII)  
  - Preferred beta-lactams: high-dose amoxicillin or amoxicillin/clavulanate  
  - Alternative beta-lactams: cefpodoxime or cefuroxime, or  
- For penicillin-allergic patients: Levofloxacin 750 mg PO once daily (AII), or moxifloxacin 400 mg PO once daily (AII)  
Duration: 7–10 days (a minimum of 5 days). Patients should be afebrile for 48–72 hours and clinically stable before stopping antibiotics. | Empiric Outpatient Therapy:  
- A PO beta-lactam + PO doxycycline (CII)  
  - Preferred beta-lactams: high-dose amoxicillin or amoxicillin/clavulanate  
  - Alternative beta-lactams: cefpodoxime or cefuroxime  
Empiric Therapy for Non-ICU Hospitalized Patients:  
- An IV beta-lactam + doxycycline (CII) | Fluoroquinolones should be used with caution in patients in whom TB is suspected but is not being treated.  
Empiric therapy with a macrolide alone is not routinely recommended, because of increasing pneumococcal resistance (BII).  
Patients receiving a macrolide for MAC prophylaxis should not receive macrolide monotherapy for empiric treatment of bacterial pneumonia.  
For patients begun on IV antibiotic therapy, switching to PO should be considered when they are clinically improved and able to tolerate oral medications.  
Chemoprophylaxis can be considered for patients with frequent recurrences of serious bacterial pneumonia (CII).  
Clinicians should be cautious about using antibiotics to prevent recurrences because of the potential for developing drug resistance and drug toxicities. |

| Empiric Outpatient Therapy:  
- A PO beta-lactam + PO doxycycline (CII)  
  - Preferred beta-lactams: high-dose amoxicillin or amoxicillin/clavulanate  
  - Alternative beta-lactams: cefpodoxime or cefuroxime  
Empiric Therapy for Non-ICU Hospitalized Patients:  
- An IV beta-lactam + doxycycline (CII) | Empiric Therapy For ICU Patients:  
- For penicillin-allergic patients: Aztreonam IV + (levofloxacin 750 mg IV once daily or moxifloxacin 400 mg IV once daily) (BII) | Empiric Therapy For Patients at Risk of Pseudomonas Pneumonia:  
- An IV antipseudomonal beta-lactam + an aminoglycoside + azithromycin (BII), or  
- Above beta-lactam + an aminoglycoside + (levofloxacin 750 mg IV once daily or moxifloxacin 400 mg IV once daily) (BII), or  
- For penicillin-allergic patients: Replace the beta-lactam with aztreonam (BII). |  |
<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| **Bacterial Respiratory Diseases (with focus on pneumonia), continued** | Empiric Therapy for ICU Patients:  
• An IV beta-lactam + IV azithromycin (AII), or  
• An IV beta-lactam + (levofloxacin 750 mg IV once daily or moxifloxacin 400 mg IV once daily) (AII)  
  • Preferred beta-lactams: ceftriaxone, cefotaxime, or ampicillin-sulbactam | Empiric Therapy for Patients at Risk of *Pseudomonas* Pneumonia:  
• An IV antipneumococcal, antipseudomonal beta-lactam + (ciprofloxacin 400 mg IV q8–12h or levofloxacin 750 mg IV once daily) (BIII)  
  • Preferred beta-lactams: piperacillin-tazobactam, cefepime, imipenem, or meropenem | Empiric Therapy for Patients at Risk for Methicillin-Resistant *Staphylococcus aureus* Pneumonia:  
• Add vancomycin IV or linezolid (IV or PO) to the baseline regimen (BIII).  
• Addition of clindamycin to vancomycin (but not to linezolid) can be considered for severe necrotizing pneumonia to minimize bacterial toxin production (CIII). |
### Table 2. Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy) (page 7 of 22)

<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| **Bacterial Enteric Infections: Empiric Therapy pending definitive diagnosis.**         | Diagnostic fecal specimens should be obtained before initiation of empiric antibiotic therapy. If culture is positive, antibiotic susceptibilities should be performed to inform antibiotic choices given increased reports of antibiotic resistance. If a culture independent diagnostic test is positive, reflex cultures for antibiotic susceptibilities should also be done. Empiric antibiotic therapy is indicated for advanced HIV patients (CD4 count <200 cells/µL or concomitant AIDS-defining illnesses), with clinically severe diarrhea (≥6 stools/day or bloody stool) and/or accompanying fever or chills. | Empiric Therapy:  
- Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (AIII)  
Therapy should be adjusted based on the results of diagnostic work-up.  
For patients with chronic diarrhea (>14 days) without severe clinical signs, empiric antibiotics therapy is not necessary, can withhold treatment until a diagnosis is made. | Oral or IV rehydration (if indicated) should be given to patients with diarrhea (AIII). Antimotility agents should be avoided if there is concern about inflammatory diarrhea, including *Clostridium difficile*-associated diarrhea (BIII).  
If no clinical response after 3-4 days, consider follow-up stool culture with antibiotic susceptibility testing or alternative diagnostic tests (e.g., toxin assays, molecular testing) to evaluate alternative diagnosis, antibiotic resistance, or drug-drug interactions.  
IV antibiotics and hospitalization should be considered in patients with marked nausea, vomiting, diarrhea, electrolyte abnormalities, acidosis, and blood pressure instability. |
| **Salmonellosis**                                                                       | All HIV-infected patients with salmonellosis should receive antimicrobial treatment due to an increase of bacteremia (by 20-100 fold) and mortality (by up to 7-fold) compared to HIV-negative individuals (AIII).  
- Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h, if susceptible (AIII)  
Duration of Therapy:  
For gastroenteritis without bacteremia:  
- If CD4 count ≥200 cells/µL: 7–14 days (BIII)  
- If CD4 count <200 cells/µL: 2–6 weeks (BIII)  
For gastroenteritis with bacteremia:  
- If CD4 count ≥200/µL: 14 days or longer duration if bacteremia persists or if the infection is complicated (e.g., if metastatic foci of infection are present) (BIII)  
- If CD4 count <200 cells/µL: 2–6 weeks (BIII)  
- Levofloxacin 750 mg (PO or IV) q24h (BIII), or  
- Moxifloxacin 400 mg (PO or IV) q24h (BIII), or  
- TMP 160 mg-SMX 800 mg (PO or IV) q12h (BIII), or  
- Ceftriaxone 1 g IV q24h (BIII), or  
- Cefotaxime 1 g IV q8h (BIII) | Oral or IV rehydration if indicated (AIII).  
Antimotility agents should be avoided (BIII).  
The role of long-term secondary prophylaxis in patients with recurrent *Salmonella* bacteremia is not well established. Must weigh benefit against risks of long-term antibiotic exposure (BIII).  
Effective ART may reduce the frequency, severity, and recurrence of salmonella infections. |
Table 2. Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy) (page 8 of 22)

<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| Salmonellosis, continued | Secondary Prophylaxis Should Be Considered For:  
- Patients with recurrent *Salmonella* gastroenteritis +/- bacteremia (CIII), or  
- Patients with CD4 <200 cells/µL with severe diarrhea (CIII) | Levofloxacin 750 mg (PO or IV) q24h (BII), or  
Moxifloxacin 400 mg (PO or IV) q24h (BII), or  
TMP 160 mg-SMX 800 mg (PO or IV) q12h (BII) (Note: *Shigella* infections acquired outside of the United States have high rates of TMP-SMX resistance), or  
Azithromycin 500 mg PO daily for 5 days (BIII) (Note: azithromycin is not recommended for patients with bacteremia [AIII]) | Therapy is indicated both to shorten duration of illness and prevent spread of infection (AIII).  
Given increasing antimicrobial resistance and limited data showing that antibiotic therapy limits transmission, antibiotic treatment may be withheld in patients with CD4 >500 cells/mm³ whose diarrhea resolves prior to culture confirmation of *Shigella* infection (CIII).  
Oral or IV rehydration if indicated (AIII).  
Antimotility agents should be avoided (BIII).  
If no clinical response after 5–7 days, consider follow-up stool culture, alternative diagnosis, or antibiotic resistance.  
Effective ART may decrease the risk of recurrence of *Shigella* infections. |
| Shigellosis | Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (AIII)  
**Duration of Therapy:**  
- *Gastroenteritis:* 7–10 days (AIII)  
(if azithromycin is used, treat for 5 days)  
- *Bacteremia:* ≥14 days (BIII)  
- *Recurrent Infections:* up to 6 weeks (BIII)  
**Note:** Increased resistance of *Shigella* to fluoroquinolones is occurring in the United States. Avoid fluoroquinolones if ciprofloxacin MIC is ≥0.12 µg/ml even if the laboratory identifies the isolate as sensitive. Many *Shigella* strains resistant to fluoroquinolones exhibit resistance to other commonly used antibiotics. Thus, antibiotic sensitivity testing of *Shigella* isolates from HIV-infected individuals should be performed routinely.  
Levofloxacin 750 mg (PO or IV) q24h (BII), or  
Moxifloxacin 400 mg (PO or IV) q24h (BII), or  
TMP 160 mg-SMX 800 mg (PO or IV) q12h (BIII) (Note: *Shigella* infections acquired outside of the United States have high rates of TMP-SMX resistance), or  
Azithromycin 500 mg PO daily for 5 days (BIII) (Note: azithromycin is not recommended for patients with bacteremia [AIII]) |  
**Note:** Azithromycin-resistant *Shigella* spp has been reported in HIV-infected MSM.  
Oral or IV rehydration if indicated (AIII).  
Antimotility agents should be avoided (BIII).  
If no clinical response after 5–7 days, consider follow-up stool culture, alternative diagnosis, or antibiotic resistance.  
There is an increasing rate of fluoroquinolone resistance in the United States (24% resistance in 2011).  
The rationale of addition of an aminoglycoside to a fluoroquinolone in bacteremic patients is to prevent emergence of quinoline resistance. |
| Campylobacteriosis | For Mild Disease and if CD4 Count >200 cells/µL:  
- No therapy unless symptoms persist for more than several days (CIII)  
For Mild-to-Moderate Disease  
**Disease (If Susceptible):**  
- Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (BIII), or  
Azithromycin 500 mg PO daily (BIII) (Note: Not for patients with bacteremia [AIII])  
For *Campylobacter* Bacteremia:  
- Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (BIII) + an aminoglycoside (BIII) | For Mild-to-Moderate Disease (If Susceptible):  
- Levofloxacin 750 mg (PO or IV) q24h (BIII), or  
Moxifloxacin 400 mg (PO or IV) q24h (BIII), or  
Add an aminoglycoside to fluoroquinolone in bacteremic patients (BIII). | Oral or IV rehydration if indicated (AIII).  
Antimotility agents should be avoided (BIII).  
If no clinical response after 5–7 days, consider follow-up stool culture, alternative diagnosis, or antibiotic resistance.  
There is an increasing rate of fluoroquinolone resistance in the United States (24% resistance in 2011).  
The rationale of addition of an aminoglycoside to a fluoroquinolone in bacteremic patients is to prevent emergence of quinoline resistance. |
Table 2. Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy) (page 9 of 22)

| Campylobacteriosis, continued | Duration of Therapy:  
  • Gastroenteritis: 7–10 days (AIII) (5 days with azithromycin)  
  • Bacteremia: ≥14 days (BIII)  
  • Recurrent bacteremia: 2–6 weeks (BIII) | For mild, outpatient disease: metronidazole 500 mg (PO) TID for 10–14 days (CII). | Effective ART may reduce the frequency, severity, and recurrence of campylobacter infections. |
| Clostridium difficile infection (CDI) | Vancomycin 125 mg (PO) QID for 10–14 days (AI)  
  For severe, life-threatening CDI, see text and references for additional information. | For severe, life-threatening CDI, see text and references for additional information. | Recurrent CDI: Treatment is the same as in patients without HIV infection. Fecal microbiota therapy may be successful and safe to treat recurrent CDI in HIV-infected patients (CIII). See text and references for additional information. |
| Bartonellosis | For Bacillary Angiomatosis, Peliosis Hepatis, Bacteremia, and Osteomyelitis:  
  • Doxycycline 100 mg PO or IV q12h (AII), or  
  • Erythromycin 500 mg PO or IV q6h (AII)  
  CNS Infections:  
  • (Doxycycline 100 mg +/- RIF 300 mg) PO or IV q12h (AIII)  
  Confirmed Bartonella Endocarditis:  
  • (Doxycycline 100 mg IV q12h + gentamicin 1 mg/kg IV q8h) for 2 weeks, then continue with doxycycline 100 mg IV or PO q12h (BII)  
  Other Severe Infections:  
  • (Doxycycline 100 mg PO or IV +/- RIF 300 mg PO or IV) q12h (BIII), or  
  • (Erythromycin 500 mg PO or IV q6h) +/- RIF 300 mg PO or IV q12h (BIII)  
  Duration of Therapy:  
  • At least 3 months (AII) | For Bacillary Angiomatosis, Peliosis Hepatis, Bacteremia, And Osteomyelitis:  
  • Azithromycin 500 mg PO daily (BIII)  
  • Clarithromycin 500 mg PO BID (BIII)  
  Confirmed Bartonella Endocarditis but with Renal Insufficiency:  
  • (Doxycycline 100 mg IV + RIF 300 mg PO or IV) q12h for 2 weeks, then continue with doxycycline 100 mg IV or PO q12h (BII) | When RIF is used, take into consideration the potential for significant interaction with ARV drugs and other medications (see Table 5 for dosing recommendations). If relapse occurs after initial (>3 month) course of therapy, long-term suppression with doxycycline or a macrolide is recommended as long as CD4 count <200 cells/µL (AIII). |

<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| Syphilis (Treponema pallidum Infection) | Early Stage (Primary, Secondary, and Early-Latent Syphilis):  
- Benzathine penicillin G 2.4 million units IM for 1 dose (AII)  
Late-Latent Disease (>1 year or of Unknown Duration, and No Signs of Neurosyphilis):  
- Benzathine penicillin G 2.4 million units IM weekly for 3 doses (AII)  
Late-Stage (Tertiary–Cardiovascular or Gummatous Disease):  
- Benzathine penicillin G 2.4 million units IM weekly for 3 doses after completion of IV therapy (CIII) | Early Stage (Primary, Secondary, and Early-Latent Syphilis):  
For penicillin-allergic patients:  
- Doxycycline 100 mg PO BID for 14 days (BII), or  
- Ceftriaxone 1 g IM or IV daily for 10–14 days (BII), or  
- Azithromycin 2 g PO for 1 dose (BII) (Note: azithromycin is not recommended for men who have sex with men or pregnant women (AII))  
Late-Latent Disease (>1 year or of Unknown Duration, and No Signs of Neurosyphilis):  
For penicillin-allergic patients:  
- Doxycycline 100 mg PO BID for 28 days (BIII)  
Neurosyphilis:  
- Procaine penicillin 2.4 million units IM daily plus probenecid 500 mg PO QID for 10–14 days (BII) +/- benzathine penicillin G 2.4 million units IM weekly for 3 doses after completion of above (CIII), or  
- For penicillin-allergic patients: Desensitization to penicillin is the preferred approach (BII); if not feasible, ceftriaxone, 2 g IV daily for 10–14 days (BII) | The efficacy of non-penicillin alternatives has not been evaluated in HIV-infected patients and they should be used only with close clinical and serologic monitoring.  
Combination of procaine penicillin and probenecid is not recommended for patients who are allergic to sulfa-containing medications (AII).  
The Jarisch-Herxheimer reaction is an acute febrile reaction accompanied by headache and myalgia that can occur within the first 24 hours after therapy for syphilis. This reaction occurs most frequently in patients with early syphilis, high non-treponemal titers, and prior penicillin treatment. |

</table>
| Mucocutaneous candidiasis | For Oropharyngeal Candidiasis:  
   Initial Episodes (For 7–14 Days):  
   **Oral Therapy**  
   • Fluconazole 100 mg PO daily (AI)  
   For Esophageal Candidiasis (For 14–21 Days):  
   • Fluconazole 100 mg (up to 400 mg) PO or IV daily (AI), or  
   • Itraconazole oral solution 200 mg PO daily (AI)  
   For Uncomplicated Vulvo-Vaginal Candidiasis:  
   • Oral fluconazole 150 mg for 1 dose (AII), or  
   • Topical azoles (clotrimazole, butoconazole, miconazole, tioconazole, or terconazole) for 3–7 days (AII)  
   For Severe or Recurrent Vulvo-Vaginal Candidiasis:  
   • Fluconazole 100–200 mg PO daily for ≥7 days (AII), or  
   • Topical antifungal ≥7 days (AII)  
| For Oropharyngeal Candidiasis:  
   Initial Episodes (For 7–14 Days):  
   **Oral Therapy**  
   • Itraconazole oral solution 200 mg PO daily (BI), or  
   • Posaconazole oral suspension 400 mg PO BID for 1 day, then 400 mg daily (BI)  
   **Topical Therapy**  
   • Clotrimazole troches, 10 mg PO 5 times daily (BI), or  
   • Miconazole mucoadhesive buccal 50-mg tablet—apply to mucosal surface over the canine fossa once daily (do not swallow, chew, or crush) (BI), or  
   • Nystatin suspension 4–6 mL QID or 1–2 flavored pastilles 4–5 times daily (BII)  
   For Esophageal Candidiasis (For 14–21 Days):  
   • Voriconazole 200 mg PO or IV BID (BI), or  
   • Isavuconazole 200mg PO as a loading dose, followed by 50 mg PO daily (BI), or  
   • Isavuconazole 400mg PO as a loading dose, followed by 100 mg PO daily (BI), or  
   • Isavuconazole 400 mg PO once-weekly (BI), or  
   • Anidulafungin 100 mg IV 1 time, then 50 mg IV daily (BI), or  
   • Caspofungin 50 mg IV daily (BI), or  
   • Micafungin 150 mg IV daily (BI), or  
   • Amphotericin B deoxycholate 0.6 mg/kg IV daily (BI), or  
   • Lipid formulation of amphotericin B 3–4 mg/kg IV daily (BII)  
   For Uncomplicated Vulvo-Vaginal Candidiasis:  
   • Itraconazole oral solution 200 mg PO daily for 3–7 days (BII)  
| Chronic or prolonged use of azoles may promote development of resistance.  
Higher relapse rate for esophageal candidiasis seen with echinocandins than with fluconazole use.  
Suppressive therapy usually not recommended (BIII) unless patients have frequent or severe recurrences.  
If Decision Is to Use Suppressive Therapy:  
**Oropharyngeal candidiasis:**  
• Fluconazole 100 mg PO daily or three times weekly (BI), or  
• Itraconazole oral solution 200 mg PO daily (CI)  
**Esophageal candidiasis:**  
• Fluconazole 100–200 mg PO daily (BI), or  
• Posaconazole 400 mg PO BID (BII)  
**Vulvo-vaginal candidiasis:**  
• Fluconazole 150 mg PO once weekly (CII) |

<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cryptococcosis</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Cryptococcal Meningitis | **Induction Therapy (for at least 2 weeks, followed by consolidation therapy):**  
• Liposomal amphotericin B 3–4 mg/kg IV daily + flucytosine 25 mg/kg PO QID (AI)  
(Note: Flucytosine dose should be adjusted in patients with renal dysfunction.)  
**Consolidation Therapy (for at least 8 weeks (AI), followed by maintenance therapy):**  
• Fluconazole 400 mg PO (or IV) daily (AI)  
**Maintenance Therapy:**  
• Fluconazole 200 mg PO daily for at least 12 months (AI)  
For Non-CNS, Extrapulmonary Cryptococcosis and Diffuse Pulmonary Disease:  
• Treatment same as for cryptococcal meningitis (BIII)  
Non-CNS Cryptococcosis with Mild-to-Moderate Symptoms and Focal Pulmonary Infiltrates:  
• Fluconazole, 400 mg PO daily for 12 months (BIII) | Cryptococcal meningitis  
**Induction Therapy (for at least 2 weeks, followed by consolidation therapy):**  
• Amphotericin B deoxycholate 0.7 mg/kg IV daily + flucytosine 25 mg/kg PO QID (AI), or  
• Amphotericin B lipid complex 5 mg/kg IV daily + flucytosine 25 mg/kg PO QID (BII), or  
• Liposomal amphotericin B 3-4 mg/kg IV daily + fluconazole 800 mg PO or IV daily (BIII), or  
• Amphotericin B deoxycholate 0.7 mg/kg IV daily + fluconazole 800 mg PO or IV daily (BII), or  
• Fluconazole 400–800 mg PO or IV daily + flucytosine 25 mg/kg PO QID (BII), or  
• Fluconazole 1200 mg PO or IV daily (CII)  
**Consolidation Therapy (for at least 8 weeks (AI), followed by maintenance therapy):**  
• Itraconazole 200 mg PO BID for 8 weeks—less effective than fluconazole (CI)  
**Maintenance Therapy:**  
• No alternative therapy recommendation | Addition of flucytosine to amphotericin B has been associated with more rapid sterilization of CSF and decreased risk for subsequent relapse.  
Patients receiving flucytosine should have either blood levels monitored (peak level 2 hours after dose should be 30–80 mcg/mL) or close monitoring of blood counts for development of cytopenia. Dosage should be adjusted in patients with renal insufficiency (BII).  
Opening pressure should always be measured when an LP is performed (AII). Repeated LPs or CSF shunting are essential to effectively manage increased intracranial pressure (BIII).  
Corticosteroids and mannitol are ineffective in reducing ICP and are NOT recommended (BII).  
Corticosteroid should not be routinely used during induction therapy unless it is used for management of IRIS (AI). |

<tbody>
<tr>
<td><strong>Cytomegalovirus (CMV) Disease</strong></td>
<td><strong>CMV Retinitis Induction Therapy (followed by Chronic Maintenance Therapy):</strong> For Immediate Sight-Threatening Lesions (within 1500 microns of the fovea):  • Intravitreal injections of ganciclovir (2 mg) or foscarnet (2.4 mg) for 1-4 doses over a period of 7-10 days to achieve high intraocular concentration faster (AIII); plus  • Valganciclovir 900 mg PO BID for 14–21 days, then 900mg once daily (AI): <strong>For Peripheral Lesions:</strong>  • Valganciclovir 900 mg PO BID for 14–21 days, then 900 mg once daily (AI) <strong>Chronic Maintenance:</strong>  • Valganciclovir 900 mg PO daily (AI) for 3-6 months until ART induced immune recovery (see Table 4) <strong>CMV Esophagitis or Colitis:</strong>  • Ganciclovir 5 mg/kg IV q12h; may switch to valganciclovir 900 mg PO q12h once the patient can tolerate oral therapy (BI)  • Duration: 21–42 days or until symptoms have resolved (CII)  • Maintenance therapy is usually not necessary, but should be considered after relapses (BII).</td>
<td><strong>CMV Retinitis</strong> For Immediate Sight-Threatening Lesions (within 1500 microns of the fovea): Intravitreal therapy as listed in the Preferred section, plus one of the following: <strong>Alternative Systemic Induction Therapy (followed by Chronic Maintenance Therapy):</strong>  • Ganciclovir 5 mg/kg IV q12h for 14–21 days (AI), or  • Foscarnet 90 mg/kg IV q12h or 60 mg/kg q8h for 14–21 days (AI), or  • Cidofovir 5 mg/kg/week IV for 2 weeks; saline hydration before and after therapy and probenecid, 2 g PO 3 hours before dose, followed by 1 g PO 2 hours and 8 hours after the dose (total of 4 g) (BI). (Note: This regimen should be avoided in patients with sulfa allergy because of cross hypersensitivity with probenecid.) <strong>Chronic Maintenance (for 3-6 months until ART induced immune recovery (see Table 4):</strong>  • Ganciclovir 5 mg/kg IV 5–7 times weekly (AI), or  • Foscarnet 90–120 mg/kg IV once daily (AI), or  • Cidofovir 5 mg/kg IV every other week with saline hydration and probenecid as above (BI) <strong>CMV Esophagitis or Colitis:</strong>  • Foscarnet 90 mg/kg IV q12h or 60 mg/kg q8h (BI) for patients with treatment-limiting toxicities to ganciclovir or with ganciclovir resistance, or  • Valganciclovir 900 mg PO q12h in milder disease and if able to tolerate PO therapy (BII), or  • Duration: 21–42 days or until symptoms have resolved (CII)  • For mild disease, if ART can be initiated without delay, consider withholding CMV therapy (CIII).</td>
<td>The choice of therapy for CMV retinitis should be individualized, based on location and severity of the lesions, level of immunosuppression, and other factors (e.g., concomitant medications and ability to adhere to treatment) (AIII). Given the evident benefits of systemic therapy in preventing contralateral eye involvement, reduce CMV visceral disease and improve survival. Whenever feasible, treatment should include systemic therapy. The ganciclovir ocular implant, which is effective for treatment of CMV retinitis is no longer available. For sight threatening retinitis, intravitreal injections of ganciclovir or foscarnet can be given to achieve higher ocular concentration faster. Routine (i.e., every 3 months) ophthalmologic follow-up is recommended after stopping chronic maintenance therapy for early detection of relapse or IRU, and then periodically after sustained immune reconstitution (AIII). IRU may develop in the setting of immune reconstitution. <strong>Treatment of IRU</strong>  • Periocular corticosteroid or short courses of systemic steroid (BIII). Initial therapy in patients with CMV retinitis, esophagitis, colitis, and pneumonitis should include initiation or optimization of ART (BIII).</td>
</tr>

| Cytomegalovirus (CMV) Disease, continued | • The optimal duration of therapy and the role of oral valganciclovir have not been established.  
  • Optimize ART to achieve viral suppression and immune reconstitution (BIII). |                     |                                                                                |
| Herpes Simplex Virus (HSV) Disease       | Orolabial Lesions (For 5–10 Days):  
  • Valacyclovir 1 g PO BID (AIII), or  
  • Famciclovir 500 mg PO BID (AIII), or  
  • Acyclovir 400 mg PO TID (AIII)  
  Initial or Recurrent Genital HSV (For 5–14 Days):  
  • Valacyclovir 1 g PO BID (AII), or  
  • Famciclovir 500 mg PO BID (AII), or  
  • Acyclovir 400 mg PO TID (AII)  
  Severe Mucocutaneous HSV:  
  • Initial therapy acyclovir 5 mg/kg IV q8h (AIII)  
  • After lesions begin to regress, change to PO therapy as above. Continue until lesions are completely healed.  
  Chronic Suppressive Therapy  
  For patients with severe recurrences of genital herpes (AII) or patients who want to minimize frequency of recurrences (AII):  
  • Valacyclovir 500 mg PO BID (AII)  
  • Famciclovir 500 mg PO BID (AII)  
  • Acyclovir 400 mg PO BID (AII)  
  • Continue indefinitely regardless of CD4 cell count. | For Acyclovir-Resistant HSV  
  Preferred Therapy:  
  • Foscarnet 80–120 mg/kg/day IV in 2–3 divided doses until clinical response (AII)  
  Alternative Therapy (CIII):  
  • IV cidofovir (dosage as in CMV retinitis), or  
  • Topical trifluridine, or  
  • Topical cidofovir, or  
  • Topical imiquimod  
  Duration of Therapy:  
  • 21–28 days or longer | Patients with HSV infections can be treated with episodic therapy when symptomatic lesions occur, or with daily suppressive therapy to prevent recurrences.  
  Topical formulations of trifluridine and cidofovir are not commercially available.  
  Extemporaneous compounding of topical products can be prepared using trifluridine opthalmic solution and the IV formulation of cidofovir. |

  • Famciclovir 500 mg TID (AII)  
  Extensive Cutaneous Lesion or Visceral Involvement:  
  • Acyclovir 10−15 mg/kg IV q8h until clinical improvement is evident (AII)  
  • May switch to PO therapy (valacyclovir, famciclovir, or acyclovir) after clinical improvement (i.e., when no new vesicle formation or improvement of signs and symptoms of visceral VZV), to complete a 10−14 day course (BIII). <br> **Progressive Outer Retinal Necrosis (PORN):**  
  • (Ganciclovir 5 mg/kg +/- foscarnet 90 mg/kg) IV q12h + (ganciclovir 2 mg/0.05mL +/- foscarnet 1.2 mg/0.05 mL) intravitreal injection BIW (AIII)  
  • Initiate or optimize ART (AIII) <br> **Acute Retinal Necrosis (ARN):**  
  • (Acyclovir 10-15 mg/kg IV q8h) + (ganciclovir 2 mg/0.05mL intravitreal injection BIW X 1-2 doses) for 10-14 days, followed by valacyclovir 1g PO TID for 6 weeks (AIII) | **Primary Varicella Infection (Chickenpox)**  
  Uncomplicated Cases (For 5-7 Days):  
  • Acyclovir 800 mg PO 5 times/day (BII)  
  **Herpes Zoster (Shingles)**  
  Acute Localized Dermatomal:  
  • For 7−10 days; consider longer duration if lesions are slow to resolve  
  • Acyclovir 800 mg PO 5 times/day (BII) | In managing VZV retinitis  
- Consultation with an ophthalmologist experienced in management of VZV retinitis is strongly recommended (AIII).  
Duration of therapy for VZV retinitis is not well defined, and should be determined based on clinical, virologic, and immunologic responses and ophthalmologic responses.  
Optimization of ART is recommended for serious and difficult-to-treat VZV infections (e.g., retinitis, encephalitis) (AIII). |

<tr>
<td>Human Papillomavirus (HPV) Disease, continued</td>
<td>ART regimen which includes 2 drugs that are active against both HBV and HIV is recommended for all HIV/HBV-co-infected patients regardless of CD4 cell count and HBV DNA level (AII). Tenofovir alafenamide (TAF)/emtricitabine or tenofovir disoproxil fumarate (TDF/emtricitabine PO once daily (+ additional drug(s) for HIV) (AIII). The choice of TAF vs. TDF should be based on renal function and risk of renal or bone toxicities. CrCl &gt;60 mL/min TDF 300 mg plus (FTC 200 mg or 3TC 300 mg)) or [TAF (10 or 25 mg) + plus FTC 200 mg] PO once daily (AII). CrCl 30-59 mL/min TAF (10 or 25 mg) + FTC 200 mg PO once daily (AII) CrCl &lt;30 mL/min A fully suppressive ART regimen without tenofovir should be used, with the addition of renally dosed entecavir to the regimen Duration: Continue treatment indefinitely (AIII) If TAF or TDF Cannot Be Used as Part of HIV/HBV Therapy: Use entecavir (dose adjustment according to renal function) plus a fully suppressive ART regimen without TAF or TDF (BIII). CrCl &lt; 30 mL/min ART with renally dose adjusted TDF and FTC can be used (BIII) if recovery of renal function is unlikely (See Table 7 for dosage recommendation) If patient is not receiving ART: • HBV treatment is indicated for elevated ALT, HBV DNA &gt;2000mIU/mL, significant liver fibrosies, advanced liver disease or cirrhosis (AI) • Peginterferon alfa-2a 180 µg SQ once weekly for 48 weeks (CIII), or • Peginterferon alfa 2b 1.5 µg/kg SQ once weekly for 48 weeks (CIII) Chronic administration of lamivudine or emtricitabine as the only active drug against HBV should be avoided because of high rate of selection of HBV resistance (AI). Directly acting HBV drugs such as adefovir, emtricitabine, entecavir, lamivudine, telbuvudine, or tenofovir must not be given in the absence of a fully suppressive ART regimen to avoid selection of drug resistance HIV (AI). When changing ART regimens, continue agents with anti-HBV activity (BIII). If anti-HBV therapy is discontinued and a flare occurs, therapy should be re-instituted because it can be potentially life-saving (AIII). As HBV reactivation can occur during treatment for HCV with directly active agents (DAAs) in the absence of HBV-active drugs, all HIV-HBV-coinfected patients who will be treated for HCV should be on HBV-active ART at the time of HCV treatment initiation (AII)</td>

Evidence Rating:

Strength of Recommendation:
A: Strong recommendation for the statement
B: Moderate recommendation for the statement
C: Optional recommendation for the statement

Quality of Evidence for the Recommendation:
I: One or more randomized trials with clinical outcomes and/or validated laboratory endpoints
II: One or more well-designed, nonrandomized trials or observational cohort studies with long-term clinical outcomes
III: Expert opinion

In cases where there are no data for the prevention or treatment of an OI based on studies conducted in HIV-infected populations, but data derived from HIV-uninfected patients exist that can plausibly guide management decisions for patients with HIV/AIDS, the data will be rated as III but will be assigned recommendations of A, B, C depending on the strength of recommendation.
