<thead>
<tr>
<th>Adverse Effects</th>
<th>Associated ARVs</th>
<th>Onset/Clinical Manifestations</th>
<th>Estimated Frequency</th>
<th>Risk Factors</th>
<th>Prevention/Monitoring</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Dyslipidemia</strong></td>
<td><strong>PIs:</strong></td>
<td>Onset:</td>
<td>Reported frequency varies with specific ARV regimen, duration of ART, and the specific laboratory parameters used to diagnose lipid abnormalities.</td>
<td>Advanced-stage HIV disease, High-fat, high-cholesterol diet, Lack of exercise, Obesity, Hypertension, Smoking, Family history of dyslipidemia or premature CVD, Metabolic syndrome, Fat maldistribution.</td>
<td>Prevention: - Low-fat diet - Exercise - Smoking-prevention counseling - When possible, use ARVs associated with a lower prevalence of dyslipidemia. These include INSTIs and newer PIs (e.g., ATV, DRV)</td>
<td>Assess all patients for additional CVD risk factors. Patients living with HIV are considered to be at moderate risk of CVD.b ART regimen changes should be considered, especially when the patient is receiving older PIs (e.g., LPV/r) and/or ritonavir boosting. Substituting a PI-sparing regimen, a PI-based regimen with a more favorable lipid profile, or COBI boosting causes a decline in LDL-C or TG values. However, the lipid-lowering effect for LDL-C is less pronounced than treatment results with statin therapy. Refer patients to a lipid specialist early if LDL-C ≥250 mg/dL or TG ≥500 mg/dL. If LDL-C is ≥130 mg/dL but &lt;250 mg, or TG is ≥150 mg/dL but &lt;500 mg/dL, a staged treatment approach is recommended by the NHLBI guidelines.8 - Implement diet, nutrition, and lifestyle management for 6 months to 9 months. Consult with a dietician if one is available. If a 6-month to 9-month trial of lifestyle modification fails and the patient is aged ≥10 years, consider implementing lipid-lowering therapy after consulting a lipid specialist.</td>
</tr>
<tr>
<td></td>
<td>• All PIs, especially RTV-boosted PIs; lower incidence reported with DRV/r and ATV with or without RTV.</td>
<td>Presentation <strong>PIs:</strong></td>
<td></td>
<td></td>
<td>Monitoring: <strong>Adolescents and Adults:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Lower incidence with TDF than with TAF</td>
<td>• ↑ LDL-C, TC, and TG</td>
<td></td>
<td></td>
<td>• Obtain FLP (TC, HDL-C, non-HDL-C, LDL-C, and TG) twice (&gt;2 weeks but ≤3 months apart, average these results) every 6 months–12 months.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Lower incidence reported with NVP, RPV, and ETR than with EFV</td>
<td>Presentation <strong>NNRTIs:</strong></td>
<td></td>
<td></td>
<td>Children (Aged ≥2 Years) without Lipid Abnormalities or Additional Risk Factors:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 40% to 75% of older children and adolescents with prolonged ART history will have lipid abnormalities.</td>
<td>• ↑ LDL-C, TC, and HDL-C</td>
<td></td>
<td></td>
<td>• Obtain nonfasting screening lipid profiles at entry into care and then every 6 months–12 months, depending on the results.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ↑ LDL-C, TC, and TG</td>
<td></td>
<td></td>
<td>• If TG or LDL-C is elevated or if a patient has additional risk factors, obtain FLP.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Increase in serum lipids from baseline has also been noted in adolescents receiving EVG/COBI/FTC/TAF.</td>
<td></td>
<td></td>
<td>Children with Lipid Abnormalities and/or Additional Risk Factors:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Obtain 12-hour FLP before initiating or changing therapy and every 6 months thereafter (more often if indicated).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Children Receiving Lipid-Lowering Therapy with Statins or Fibrates:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Obtain 12-hour FLP, LFT, and CK at 4 and 8 weeks, and 3 months after starting lipid therapy.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

### Table 15b. Antiretroviral Therapy-Associated Adverse Effects and Management Recommendations—Dyslipidemia

(last updated April 16, 2019; last reviewed April 16, 2019) (page 2 of 2)

<table>
<thead>
<tr>
<th>Adverse Effects</th>
<th>Associated ARVs</th>
<th>Onset/Clinical Manifestations</th>
<th>Estimated Frequency</th>
<th>Risk Factors</th>
<th>Prevention/Monitoring</th>
<th>Management</th>
</tr>
</thead>
</table>
| Dyslipidemia, continued |                |                              |                     |             |                        | • Statin therapy should be considered for patients with elevated LDL-C levels. NHLBI provides recommendations for statin therapy in patients with specific LDL-C levels and risk factors.
|                  |                 |                              |                     |             |                        | • Drug therapy can be considered in cases of severe hypertriglyceridemia (TG ≥500 mg/dL). Fibrates (gemfibrozil and fenofibrate) and N-3 PUFAs derived from fish oils may be used.
|                  |                 |                              |                     |             |                        | The long-term risks of lipid abnormalities in children receiving ART are unclear. However, persistent dyslipidemia in children may lead to premature CVD. |

---

**Key to Acronyms:**
- ALT = alanine aminotransferase; ART = antiretroviral therapy; ARV = antiretroviral; AST = aspartate aminotransferase; ATV = atazanavir; CK = creatine kinase; COBI = cobicistat; CVD = cardiovascular disease; DRV = darunavir; DRV/r = darunavir/ritonavir; EFV = efavirenz; ETR = etravirine; EVG = elvitegravir; FLP = fasting lipid profile; FTC = emtricitabine; HDL-C = high-density lipoprotein cholesterol; INSTI = integrase strand transfer inhibitor; LDL-C = low-density lipoprotein cholesterol; LFT = liver function test; LPV/r = lopinavir/ritonavir; NHLBI = National Heart, Lung, and Blood Institute; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside reverse transcriptase inhibitor; NVP = nevirapine; PI = protease inhibitor; PUFAs = polyunsaturated fatty acid; RPV = rilpivirine; RTV = ritonavir; TAF = tenofovir alafenamide; TC = total cholesterol; TDF = tenofovir disoproxil fumarate; TG = triglyceride
