# Bacterial Infections

(Last updated November 6, 2013; last reviewed November 6, 2013)

## Dosing Recommendations for Prevention and Treatment of Invasive Bacterial Infections

<table>
<thead>
<tr>
<th>Indication</th>
<th>First Choice</th>
<th>Alternative</th>
<th>Comments/Special Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Primary Prophylaxis</strong></td>
<td></td>
<td></td>
<td>See Figures 1 and 2 for detailed vaccines recommendations.</td>
</tr>
<tr>
<td><em>S. pneumoniae</em> and other invasive bacteria</td>
<td>• Pneumococcal, meningococcal, and Hib vaccines</td>
<td>• TMP-SMX 75/375 mg/m² body surface area per dose by mouth twice daily</td>
<td>Vaccines Routinely Recommended for Primary Prophylaxis. Additional Primary Prophylaxis Indicated For:</td>
</tr>
<tr>
<td></td>
<td>• IVIG 400 mg/kg body weight every 2–4 weeks</td>
<td></td>
<td>• Hypogammaglobulinemia (that is, IgG &lt;400 mg/dL)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Criteria for Discontinuing Primary Prophylaxis:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Resolution of hypogammaglobulinemia</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Criteria for Restarting Primary Prophylaxis:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Relapse of hypogammaglobulinemia</td>
</tr>
<tr>
<td><strong>Secondary Prophylaxis</strong></td>
<td></td>
<td></td>
<td>Secondary Prophylaxis Indicated:</td>
</tr>
<tr>
<td><em>S. pneumoniae</em> and other invasive bacteria</td>
<td>• TMP-SMX 75/375 mg/m² body surface area per dose by mouth twice daily</td>
<td>• IVIG 400 mg/kg body weight every 2–4 weeks</td>
<td>• &gt;2 serious bacterial infections in a 1-year period in children who are unable to take cART</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Criteria for Discontinuing Secondary Prophylaxis:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Sustained (≥ 3 months) immune reconstitution (CD4 percentage ≥25% if ≤6 years old; CD4 percentage ≥20% or CD4 count &gt;350 cells/mm³ if &gt;6 years old)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Criteria For Restarting Secondary Prophylaxis:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• &gt;2 serious bacterial infections in a 1-year period despite cART</td>
</tr>
<tr>
<td><strong>Treatment</strong></td>
<td></td>
<td></td>
<td>For children who are receiving effective cART, have mild or no immunosuppression, and have mild to moderate community-acquired pneumonia, oral therapy option would be amoxicillin 45 mg/kg body weight per dose twice daily (maximum dose: 4 g per day).</td>
</tr>
<tr>
<td>Bacterial pneumonia; <em>S. pneumoniae</em></td>
<td>• Ceftriaxone 50–100 mg/kg body weight per dose once daily, or 25–50 mg/kg body weight per dose twice daily IV or IM (max 4 g/day), or</td>
<td>• Cefuroxime, 35–50 mg/kg body weight per dose 3 times daily (max 4–6 g/day) IV</td>
<td>Add azithromycin for hospitalized patients to treat other common community-acquired pneumonia pathogens (<em>M. pneumoniae, C. pneumoniae</em>).</td>
</tr>
<tr>
<td>occasionally <em>S. aureus, H. influenzae, P. aeruginosa</em></td>
<td>• Cefotaxime 40–50 mg/kg body weight per dose 4 times daily, or 50–65 mg/kg body weight 3 times daily (max 8–10 g/day) IV</td>
<td></td>
<td>Add clindamycin or vancomycin if methicillin-resistant <em>S. aureus</em> is suspected (base the choice on local susceptibility patterns).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For patients with neutropenia, chronic lung disease other than asthma (e.g., LIP, bronchiectasis) or indwelling venous catheter, consider regimen that includes activity against <em>P. aeruginosa</em> (such as ceftazidime or cefepime instead of ceftriaxone).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Consider PCP in patients with severe pneumonia or more advanced HIV disease.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Evaluate for tuberculosis, cryptococcosis, and endemic fungi as epidemiology suggests.</td>
</tr>
</tbody>
</table>

**Key to Acronyms:**
cART = combination antiretroviral therapy; CD4 = CD4 T lymphocyte; IgG = immunoglobulin G; IM = intramuscular; IV = intravenous; IVIG = intravenous immune globulin; LIP = lymphocytic interstitial pneumonia; PCP = *Pneumocystis jiroveci* pneumonia; TMP-SMX = trimethoprim-sulfamethoxazole

### Key to Abbreviations:

- BSA = body surface area
- CD4 = CD4 T lymphocyte
- CDC = Centers for Disease Control and Prevention
- IV = intravenous
- PK = pharmacokinetic
### Coccidioidomycosis (Last updated November 6, 2013; last reviewed November 6, 2013)

#### Dosing Recommendations for Prevention and Treatment of Coccidioidomycosis

<table>
<thead>
<tr>
<th>Indication</th>
<th>First Choice</th>
<th>Alternative</th>
<th>Comments/Special Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Primary Prophylaxis</strong></td>
<td>N/A</td>
<td>N/A</td>
<td>Primary prophylaxis not routinely indicated in children.</td>
</tr>
<tr>
<td><strong>Secondary Prophylaxis</strong></td>
<td>Fluconazole 6 mg/kg body weight (maximum 400 mg) by mouth once daily</td>
<td>Itraconazole 2–5 mg/kg body weight (maximum 200 mg) by mouth per dose twice daily</td>
<td>Lifelong secondary prophylaxis with fluconazole for patients with meningitis or disseminated disease in the immunocompromised patient is recommended. Secondary prophylaxis should be considered after treatment of milder disease if CD4 count remains &lt;250 cells/mm³ or CD4 percentage &lt;15%.</td>
</tr>
</tbody>
</table>
| **Treatment**               | **Severe Illness with Respiratory Compromise due to Diffuse Pulmonary or Disseminated Non-Meningitic Disease:**  
|                            | • Amphotericin B deoxycholate 0.5–1.0 mg/kg body weight IV once daily, until clinical improvement.  
|                            | • A lipid amphotericin B preparation can be substituted at a dose of 5 mg/kg body weight IV once daily (dosage of the lipid preparation can be increased to as much as 10 mg/kg body weight IV once daily for life-threatening infection).  
|                            | • After the patient is stabilized, therapy with an azole (fluconazole or itraconazole) can be substituted and continued to complete a 1-year course of antifungal therapy. | Surgical debridement of bone, joint, and/or excision of cavitary lung lesions may be helpful.  
|                            | Itraconazole 12mg/kg body weight (maximum 800 mg) per dose IV or by mouth once daily | Fluconazole 12mg/kg body weight (maximum 800 mg) per dose IV or by mouth once daily | Itraconazole is the preferred azole for treatment of bone infections. Some experts initiate an azole during amphotericin B therapy; others defer initiation of the azole until after amphotericin B is stopped. For treatment failure, can consider voriconazole, caspofungin, or posaconazole (or combinations). However, experience is limited and definitive pediatric dosages have not been determined. Options should be discussed with an expert in the treatment of coccidioidomycosis.  
|                            | • Treatment is continued for total of 1 year, followed by secondary prophylaxis. | **Meningeal Infection (Unresponsive to Fluconazole):**  
|                            | • IV amphotericin B plus intrathecal amphotericin B followed by secondary prophylaxis. Note: Expert consultation recommended. | Chronic suppressive therapy (secondary prophylaxis) with fluconazole or itraconazole is routinely recommended following initial induction therapy for disseminated disease and is continued lifelong for meningeal disease. Therapy with amphotericin results in a more rapid clinical response in severe, non-meningeal disease.  
|                            | **Mild-to-Moderate Non-Meningeal Infection (e.g., Focal Pneumonia):**  
|                            | • Fluconazole 6–12 mg/kg body weight (maximum 400 mg) per dose IV or by mouth once daily. | **Mild-to-Moderate Non-Meningeal Infection (e.g., Focal Pneumonia):**  
|                            | • Itraconazole 2–5 mg/kg body weight per dose (maximum dose 200 mg) per dose IV or by mouth 3 times daily for 3 days, then 2–5 mg/kg body weight (maximum dose 200 mg) by mouth per dose twice daily thereafter.  
|                            | • Duration of treatment determined by rate of clinical response. |  
|                            | • Duration of treatment determined by rate of clinical response. |  

**Key to Abbreviations:** CD4 = CD4 T lymphocyte; IV = intravenous

#### Treatment

| CNS Disease | CNS Disease (Minimum 2-Week Induction Followed by Consolidation Therapy):<br>**Acute Therapy**<br>• Amphotericin B deoxycholate 1.0 mg/kg body weight (or liposomal amphotericin B 6 mg/kg body weight) IV once daily **PLUS** flucytosine 25 mg/kg body weight per dose by mouth given 4 times daily | CNS Disease (Minimum 2-Week Induction Followed by Consolidation Therapy):<br>**Acute Therapy**<br>• Amphotericin B deoxycholate 1.0–1.5 mg/kg body weight IV once daily alone or B. in combination with high-dose fluconazole (12 mg/kg body weight on day 1 and then 10–12 mg/kg body weight [max 800 mg] IV). **Note:** Data-driven pediatric dosing guidelines are unavailable for fluconazole with use of such combination therapy. | In patients with meningitis, CSF culture should be negative prior to initiating consolidation therapy. Overall, *in vitro* resistance to antifungal agents used to treat cryptococcosis remains uncommon. Newer azoles (voriconazole, posaconazole, ravuconazole) are all very active *in vitro* against *C. neoformans*, but published clinical experience on their use for cryptococcosis is limited. |

If Flucytosine Not Tolerated or Unavailable: **A.** Liposomal amphotericin B, 6 mg/kg body weight IV once daily, or Amphotericin B Lipid Complex, 5 mg/kg body weight IV once daily, or Amphotericin B deoxycholate, 1.0–1.5 mg/kg body weight IV once daily **alone or B. in combination** with high-dose fluconazole (12 mg/kg body weight on day 1 and then 10–12 mg/kg body weight [max 800 mg] IV).
### Indication | First Choice | Alternative | Comments/Special Issues
--- | --- | --- | ---
**Treatment, continued**<br>Consolidation Therapy (Followed by Secondary Prophylaxis):<br>• Fluconazole 12 mg/kg body weight on day 1, then 10–12 mg/kg body weight (max 800 mg) once daily IV or by mouth for a minimum of 8 weeks<br><br>**Localized Disease, Including Isolated Pulmonary Disease (CNS Not Involved):**<br>• Fluconazole 12 mg/kg body weight on day 1 and then 6–12 mg/kg body weight (max 600 mg) IV or by mouth once daily<br><br>**Disseminated Disease (CNS Not Involved) or Severe Pulmonary Disease:**<br>• Amphotericin B 0.7–1.0 mg/kg body weight, or<br>• Liposomal amphotericin, 3–5 mg/kg body weight, or<br>• Amphotericin B lipid complex 5 mg/kg body weight IV once daily (± flucytosine)<br><br>**If Amphotericin B-Based Therapy Not Tolerated:**<br>• Fluconazole, 12 mg/kg body weight on day 1 and then 10–12 mg/kg body weight (max 800 mg) IV or by mouth once daily PLUS flucytosine, 25 mg/kg body weight per dose by mouth given 4 times daily<br><br>Consolidation Therapy (followed by secondary prophylaxis):<br>• Itraconazole 5–10 mg/kg body weight by mouth given once daily, or 2.5–5 mg/kg body weight given twice daily (maximum 200 mg/dose) for a minimum of 8 weeks. A loading dose (2.5–5 mg/kg body weight per dose 3 times daily) is given for the first 3 days (maximum 200 mg/dose; 600 mg/day). See comment on itraconazole under Other Options/Issues.<br><br>Localized Disease Including Isolated Pulmonary Disease (CNS Not Involved):<br>• Amphotericin B, 0.7–1.0 mg/kg body weight, or<br>• Amphotericin liposomal 3–5 mg/kg body weight, or<br>• Amphotericin lipid complex, 5 mg/kg body weight IV once daily<br><br>Disseminated disease (CNS not involved) or severe, pulmonary disease:<br>• Fluconazole, 12 mg/kg body weight on day 1 and then 6–12 mg/kg body weight (max 600 mg) IV or by mouth once daily<br><br>Liposomal amphotericin and amphotericin B lipid complex are especially useful for children with renal insufficiency or infusion-related toxicity to amphotericin B deoxycholate.<br><br>Liposomal amphotericin and amphotericin B lipid complex are significantly more expensive than amphotericin B deoxycholate.<br><br>Local preparation of itraconazole (if tolerated) is preferable to tablet formulation because of better bioavailability, but it is more expensive. Bioavailability of the solution is better than the capsule, but there were no upfront differences in dosing range based on preparation used. Ultimate dosing adjustments should be guided by itraconazole levels.<br><br>Serum itraconazole concentrations should be monitored to optimize drug dosing.<br><br>Amphotericin B may increase toxicity of flucytosine by increasing cellular uptake, or impair its renal excretion, or both.<br><br>Flucytosine dose should be adjusted to keep 2-hour post-dose drug levels at 40–60 μg/mL.<br><br>Oral acetazolamide should not be used for reduction of ICP in cryptococcal meningitis.<br><br>Corticosteroids and mannitol have been shown to be ineffective in managing ICP in adults with cryptococcal meningitis.<br><br>Secondary prophylaxis is recommended following completion of initial therapy (induction plus consolidation)—drugs and dosing listed above.

---

**Key to Acronyms:** cART = combination antiretroviral therapy; CNS = central nervous system; CSF = cerebrospinal fluid; ICP = intracranial pressure; IV = intravenous

---

*a* Secondary prophylaxis is also referred to as maintenance therapy or suppressive therapy.<br>

*b* Duration of therapy for non-CNS disease depends on site and severity of infection and clinical response.

### Dosing Recommendations for Preventing and Treating CMV

<table>
<thead>
<tr>
<th>Indication</th>
<th>First Choice</th>
<th>Alternative</th>
<th>Comments/Special Issues</th>
</tr>
</thead>
</table>
| **Primary Prophylaxis**| • For older children who can receive adult dose (based on their BSA), valganciclovir tablets 900 mg orally once daily with food  
• For children aged 4 months–16 years, valganciclovir oral solution 50 mg/mL at dose in milligrams = 7 x BSA x CrCl (up to maximum CrCl of 150 mL/min/1.73 m²) orally once daily with food (maximum dose 900 mg/day) | N/A         | Primary Prophylaxis Can Be Considered for:  
• CMV antibody positivity and severe immunosuppression (i.e., CD4 cell count <50 cells/mm³ in children ≥6 years; CD4 percentage <5% in children <6 years)  
Criteria for Discontinuing Primary Prophylaxis:  
• CD4 cell count >100 cells/mm³ for children ≥6 years; CD4 percentage >10% in children <6 years  
Criteria for Considering Restarting Primary Prophylaxis:  
• CD4 cell count <50 cells/mm³ in children ≥6 years; CD4 percentage <5% in children <6 years |
| **Secondary Prophylaxis**| • Ganciclovir 5 mg/kg body weight IV once daily, or  
• For older children who can receive adult dose (based on their BSA), valganciclovir tablets 900 mg orally once daily with food, or  
• For children age 4 months–16 years, valganciclovir oral solution 50 mg/mL (at dose in milligrams = 7 x BSA x CrCl up to maximum CrCl of 150 mL/min/1.73 m²) orally once daily with food, or  
• Foscarnet 90–120 mg/kg body weight IV once daily  
• Cidofovir 5 mg/kg body weight per dose IV every other week. Must be given with probenecid and IV hydration. | Foscarnet 90–120 mg/kg body weight IV once daily  
• Cidofovir 5 mg/kg body weight per dose IV every other week. Must be given with probenecid and IV hydration. | Secondary Prophylaxis Indicated For:  
• Prior disseminated disease, retinitis, neurologic disease, or GI disease with relapse  
Criteria for Discontinuing Secondary Prophylaxis:  
If All of the Following Criteria Are Fulfilled:  
• Completed ≥6 months of CART  
• Consultation with ophthalmologist (if retinitis)  
• Age <6 years with CD4 percentage ≥15% for >6 consecutive months  
• Age ≥6 years with CD4 cell count >100 cells/mm³ for >6 consecutive months  
• For retinitis, routine (i.e., every 3–6 months) ophthalmological follow-up is recommended for early detection of relapse or immune restoration uveitis.  
Criteria for Restarting Secondary Prophylaxis:  
• Age <6 years with CD4 percentage <15%  
• Age ≥6 years with CD4 cell count <100 cells/mm³ |

<td>Treatment</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Symptomatic Congenital Infection with Neurologic Involvement:</td>
<td>Ganciclovir 6 mg/kg body weight per dose IV every 12 hours for 6 weeks</td>
<td>Disseminated Disease and Retinitis: Induction Therapy (Followed by Chronic Suppressive Therapy):</td>
<td></td>
</tr>
<tr>
<td>Disseminated Disease and Retinitis: Induction Therapy (Followed by Chronic Suppressive Therapy):</td>
<td>Ganciclovir 5 mg/kg body weight per dose IV every 12 hours for 14–21 days (may be increased to 7.5 mg/kg body weight per dose IV twice daily), then 5 mg/kg body weight once daily for 5–7 days per week for chronic suppression</td>
<td>• Foscarnet, 60 mg/kg body weight per dose IV every 8 hours or 90 mg/kg body weight per dose IV every 12 hours x 14 to 21 days, then 90–120 mg/kg body weight IV once daily for chronic suppression</td>
<td></td>
</tr>
<tr>
<td>Central Nervous System Disease (Followed by Chronic Suppressive Therapy):</td>
<td>• Ganciclovir 5 mg/kg body weight per dose IV every 12 hours PLUS foscarnet 60 mg/kg body weight per dose IV every 8 hours (or 90 mg/kg body weight per dose IV every 12 hours) continued until symptomatic improvement, followed by chronic suppression</td>
<td>Alternatives for Retinitis (Followed by Chronic Suppressive Therapy; See Secondary Prophylaxis):</td>
<td></td>
</tr>
<tr>
<td>• Ganciclovir 5 mg/kg body weight per dose IV every 12 hours PLUS foscarnet 60 mg/kg body weight per dose IV every 8 hours (or 90 mg/kg body weight per dose IV every 12 hours) continued until symptomatic improvement, followed by chronic suppression</td>
<td>• Valganciclovir tablets 900 mg per dose orally twice daily for 14–21 days, followed by chronic suppressive therapy (see above). Note: This is an option in older children who can receive the adult dose (based on their BSA).</td>
<td>• Data on valganciclovir dosing in young children for treatment of retinitis are unavailable, but consideration can be given to transitioning from IV ganciclovir to oral valganciclovir after improvement of retinitis is noted.</td>
<td></td>
</tr>
<tr>
<td>• IV ganciclovir plus IV foscarnet (at above induction doses) may be considered as initial induction therapy in children with sight-threatening disease or for treatment following failure/relapse on monotherapy.</td>
<td>• Cidofovir is also used to treat CMV retinitis in adults intolerant to other therapies. Induction dosing in adults is 5 mg/kg body weight IV once weekly for 2 weeks, followed by chronic suppressive therapy (see secondary prophylaxis); however, data on dosing in children are unavailable. Must be given with probenecid and IV hydration</td>
<td>• Intravitreal injections of ganciclovir, foscarnet, or cidofovir are used in adults for retinitis but are not practical for most children.</td>
<td></td>
</tr>
<tr>
<td>• Cidofovir is also used to treat CMV retinitis in adults intolerant to other therapies. Induction dosing in adults is 5 mg/kg body weight IV once weekly for 2 weeks, followed by chronic suppressive therapy (see secondary prophylaxis); however, data on dosing in children are unavailable. Must be given with probenecid and IV hydration</td>
<td>• Combination ganciclovir and foscarnet is associated with substantial rates of adverse effects, and optimal treatment for neurologic disease in children is unknown, particularly if receiving optimized cART.</td>
<td>• Chronic suppressive therapy (secondary prophylaxis) is recommended in adults and children following initial therapy of disseminated disease, retinitis, neurologic disease, or GI disease with relapse.</td>
<td></td>
</tr>

### Preventive Regimen

<table>
<thead>
<tr>
<th>Indication</th>
<th>First Choice</th>
<th>Alternative</th>
<th>Comments/Special Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Treatment</td>
<td>• For children aged ≥2 years, include tenofovir as part of cART regimen with 3TC or FTC. For children aged ≥12, tenofovir dose is 300 mg once daily. For children aged &lt;12 year, and 8 mg/kg body weight per dose once daily (maximum dose 300 mg)</td>
<td></td>
<td>infection in children aged ≥2 years but it is not approved for treatment of HBV infection in children aged &lt;12 years. It should only be used for HBV in HIV/HBV-infected children as part of a cART regimen.</td>
</tr>
<tr>
<td></td>
<td>Treatment of Both HIV and HBV Required (Child Already Receiving cART Containing 3TC or FTC, Suggesting 3TC/FTC Resistance):</td>
<td></td>
<td>Adeovir is approved for use in children aged ≥12 years.</td>
</tr>
<tr>
<td></td>
<td>• For children aged ≥2 years, include tenofovir as part of cART regimen with 3TC or FTC. For children aged ≥12 years, tenofovir dose is 300 mg once daily. For children aged &lt;12 years, 8 mg/kg body weight per dose once daily (maximum dose 300 mg)</td>
<td></td>
<td>ETV is not approved for use in children younger than age 16 years, but is under study in HIV-uninfected children for treatment of chronic hepatitis B. Can be considered for older HIV-infected children who can receive adult dosage. It should only be used for HBV in HIV/HBV-infected children who also receive an HIV-suppressive cART regimen.</td>
</tr>
<tr>
<td></td>
<td>• For children aged ≥12 years, add adeovir 10 mg by mouth once daily or entecavir 0.5 mg by mouth once daily in addition to cART regimen.</td>
<td></td>
<td>IRIS may be manifested by dramatic increase in transaminases as CD4 cell counts rise within the first 6 to 12 weeks of cART. It may be difficult to distinguish between drug-induced hepatotoxicity and other causes of hepatitis and IRIS.</td>
</tr>
<tr>
<td></td>
<td>• For children aged &lt;12 years, give 6-month course of IFN-α as above in addition to cART regimen.</td>
<td></td>
<td>In children receiving tenofovir and 3TC or FTC, clinical and laboratory exacerbations of hepatitis (flare) may occur if the drug is discontinued; thus, once anti-HIV/HBV therapy has begun, it should be continued unless contraindicated or until the child has been treated for &gt;6 months after HBeAg seroconversion and can be closely monitored on discontinuation.</td>
</tr>
</tbody>
</table>

*Key to Acronyms:* 3TC = lamivudine; cART = combined antiretroviral therapy; CD4 = CD4 T lymphocyte; FTC = emtricitabine; HBeAg = hepatitis B antigen; HBV = hepatitis B virus; IFN-α = interferon alfa; IRIS = immune reconstitution inflammatory syndrome; SQ = subcutaneous; tenofovir = tenofovir disoproxil fumarate

<td>IFN-α Plus Ribavirin Combination Therapy: Pegylated IFN-α: Peg-IFN 2a 180 µg/1.73 m² body surface area subcutaneously once per week (maximum dose 180 µg) OR Peg-IFN 2b 60 µg/m² body surface area once per week PLUS Ribavirin (oral) 7.5 mg/kg body weight twice daily (fixed dose by weight recommended): 25–36 kg: 200 mg a.m. and p.m. &gt;36 to 49 kg: 200 mg a.m. and 400 mg p.m. &gt;49 to 61 kg: 400 mg a.m. and p.m. &gt;61 to 75 kg: 400 mg a.m. and 600 mg p.m. &gt;75 kg: 600 mg a.m. and p.m.</td>
<td>None</td>
<td>Optimal duration of treatment for HIV/HCV-coinfected children is unknown and based on recommendations for HIV/HCV-coinfected adults. Treatment of HCV in children &lt;3 years generally is not recommended. Indications for treatment are based on recommendations in HIV/HCV-coinfected adults; because HCV therapy is more likely to be effective in younger patients and in those without advanced disease or immunodeficiency, treatment should be considered for all HIV/HCV-coinfected children aged &gt;3 years in whom there are no contraindications to treatment. For recommendations related to use of telaprevir or boceprevir in adults, including warnings about drug interactions between HCV protease inhibitors and HIV protease inhibitors and other antiretroviral drugs, see Adult OI guidelines. IRIS may be manifested by dramatic increase in transaminases as CD4 cell counts rise within the first 6–12 weeks of cART. It may be difficult to distinguish between IRIS and drug-induced hepatotoxicity or other causes of hepatitis. IFN-α is contraindicated in children with decompensated liver disease, significant cytopenias, renal failure, severe cardiac disorders and non-HCV-related autoimmune disease. Ribavirin is contraindicated in children with unstable cardiopulmonary disease, severe pre-existing anemia or hemoglobinopathy. Didanosine combined with ribavirin may lead to increased mitochondrial toxicities; concomitant use is contraindicated. Ribavirin and zidovudine both are associated with anemia, and when possible, should not be administered together.</td>
</tr>
</tbody>
</table>

**Key to Acronyms:** cART = combined antiretroviral therapy; HCV = hepatitis C virus; IFN = interferon; IRIS = immune reconstitution inflammatory syndrome; Peg-IFN = pegylated interferon; SQ = subcutaneous

<td>For First-Episode Genital Herpes (Adults and Adolescents):</td>
<td>• Acyclovir 20 mg/kg body weight (maximum 400 mg/dose) dose by mouth TID for 7–10 days</td>
<td>• Immunocompetent adults with recurrent herpes labialis can be treated with famciclovir, 1 g/dose by mouth BID for 1 day.</td>
<td></td>
</tr>
<tr>
<td>Recurrent Genital Herpes (Adults and Adolescents):</td>
<td>• Acyclovir 20 mg/kg body weight (maximum 400 mg/dose) dose by mouth TID for 5 days</td>
<td>• Famciclovir is approved to treat primary genital HSV in immunocompetent adults at a dose of 250 mg/dose by mouth TID for 7–10 days.</td>
<td></td>
</tr>
<tr>
<td>Children with HSV Keratoconjunctivitis:</td>
<td>• Often treated with topical trifluridine (1%) or acyclovir (3%) applied as 1–2 drops 5 times daily. Many experts add oral acyclovir to the topical therapy.</td>
<td>• Recurrent genital HSV is treated with famciclovir 1 g/dose by mouth BID at a 12-hour interval for 2 doses.</td>
<td></td>
</tr>
<tr>
<td>Children with ARN:</td>
<td>• For children old enough to receive adult dose, acyclovir 10–15 mg/kg body weight/dose IV every 8 hours for 10–14 days, followed by oral valacyclovir 1 g/dose TID for 4–6 weeks</td>
<td>• Famciclovir is approved for use in HIV-infected adults and adolescents with recurrent mucocutaneous HSV infection at a dose of 500 mg/dose by mouth BID for 7 days.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• As an alternative, oral acyclovir 20 mg/kg body weight/dose QID for 4–6 weeks after IV acyclovir for 10–14 days</td>
<td>• Acyclovir-resistant HSV Infection:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Foscarnet 40 mg/kg body weight/dose given IV TID (or 60 mg/kg body weight/dose BID) should be administered slowly over the course of 2 hours (i.e., no faster than 1 mg/kg/minute).</td>
<td></td>
</tr>
<tr>

### Treatment

- **Podofilox solution/gel (0.5%)** applied topically BID for 3 consecutive days a week up to 4 weeks (patient applied). Withhold treatment for 4 days and repeat the cycle weekly up to 4 times (BIII)
- **Imiquimod cream (5%)** applied topically at night and washed off in the morning for 3 non-consecutive nights a week for up to 16 weeks (patient applied) (BII)
- **TCA or BCA (80%–90%)** applied topically weekly for up to 3 to 6 weeks (provider applied) (BIII)
- **Podophyllin resin (10%–25% suspension in tincture of benzoin)** applied topically and washed off several hours later, repeated weekly for 3 to 6 weeks (provider applied) (CIII)
- **Cryotherapy with liquid nitrogen or cryoprobe** applied every 1–2 weeks (BIII)
- **Surgical removal either by tangential excision, tangential shave excision, curettage, or electrosurgery**
- **Intralesional IFN-α** is generally not recommended because of high cost, difficult administration, and potential for systemic side effects (CIII)
- **Cidofovir topical gel (1%)** is an experimental therapy studied in HIV-infected adults that is commercially available through compounding pharmacies and has very limited use in children; systemic absorption can occur (CIII). Adequate topical anesthetics to the genital area should be given before caustic modalities are applied.
- **5-FU/epinephrine gel implant** should be offered in only severe recalcitrant cases because of inconvenient routes of administration, frequent office visits, and a high frequency of systemic adverse effects.

### Key to Acronyms:
- 5-FU = 5-fluorouracil
- BCA = bichloroacetic acid
- BID = twice daily
- cART = combination antiretroviral therapy
- HPV = human papillomavirus
- HSIL = high-grade squamous intraepithelial lesion
- IFN-α = interferon alfa
- TCA = trichloroacetic acid
- TID = three times daily

### Dosing Recommendations for Chemoprophylaxis and Treatment of Influenza

<table>
<thead>
<tr>
<th>Indication</th>
<th>First Choice</th>
<th>Alternative</th>
<th>Comments/Special Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Primary Chemoprophylaxis (Pre- and Post-Exposure)</strong> Influenza A and B</td>
<td>Oseltamivir</td>
<td>None</td>
<td>Pre-Exposure Chemoprophylaxis</td>
</tr>
<tr>
<td></td>
<td>• Aged &lt;3 Months: Not recommended</td>
<td></td>
<td>Indications:</td>
</tr>
<tr>
<td></td>
<td>• Aged 3 Months to &lt;1 Year: Oseltamivir 3 mg/kg body weight/dose once daily</td>
<td></td>
<td>• After careful consideration of risks and benefits, pre-exposure antiviral chemoprophylaxis may be considered for children with HIV with severe immunosuppression while influenza virus is circulating in the community.</td>
</tr>
<tr>
<td></td>
<td>• Aged ≥1 to 12 Years: Weight-band dosing</td>
<td></td>
<td>Duration:</td>
</tr>
<tr>
<td></td>
<td>• Weighing ≤15 kg: Oseltamivir 30 mg once daily</td>
<td></td>
<td>• When employed, pre-exposure antiviral chemoprophylaxis should continue for the duration of influenza virus circulation in the community.</td>
</tr>
<tr>
<td></td>
<td>• Weighing &gt;15 kg to 23 kg: Oseltamivir 45 mg once daily</td>
<td></td>
<td>Post-Exposure Chemoprophylaxis</td>
</tr>
<tr>
<td></td>
<td>• Weighing &gt;23 kg to 40 kg: Oseltamivir 60 mg once daily</td>
<td></td>
<td>Indications Recommended For:</td>
</tr>
<tr>
<td></td>
<td>• Weighing &gt;40 kg: Oseltamivir 75 mg once daily</td>
<td></td>
<td>• Children with HIV with severe immunosuppression regardless of influenza vaccination status.</td>
</tr>
<tr>
<td></td>
<td>• Aged ≥13 Years: Oseltamivir 75 mg once daily</td>
<td></td>
<td>• Children with HIV with moderate to no immunosuppression if</td>
</tr>
<tr>
<td>Zanamivir (Aged ≥5 Years):</td>
<td>Oseltamivir 10 mg (2 inhalations) once daily</td>
<td></td>
<td>• Influenza vaccination is contraindicated or unavailable; or</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Low influenza vaccine effectiveness is documented in the current influenza season; and</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Antiviral chemoprophylaxis can be started within 48 hours of exposure to an ill person with confirmed or suspected influenza.</td>
</tr>
</tbody>
</table>

**Note:** Duration of chemoprophylaxis depends on the type of exposure, whether influenza vaccination was provided after the exposure, and whether influenza vaccine is anticipated to be effective based on the child’s degree of immunosuppression and the degree of match with circulating influenza viruses.

- If influenza vaccination is provided after contact, chemoprophylaxis duration should be 2 weeks after vaccination.
- If exposure is to a household contact, chemoprophylaxis duration should be 7 days.
- If chemoprophylaxis is provided in setting of an institutional outbreak, the duration is either 14 days or 7 days after onset of symptoms in the last person infected, whichever is longer.

**Oseltamivir Dosing Adjustments**

**Premature Infants:**

- Current weight-based dosing recommendations for oseltamivir are not appropriate for premature infants (i.e., gestational age at delivery <38 weeks).

**Renal Insufficiency:**

- A reduction in dose of oseltamivir is recommended for patients with CrCl <30 mL/min. For patients with CrCl 10–30 mL/min, a reduction in chemoprophylaxis dosing frequency to every other day is recommended. Pharmacokinetic data are limited for dosing recommendations for patients with severe renal insufficiency on dialysis.

<sup>a</sup> Oseltamivir is FDA-approved for prophylaxis of influenza in children aged ≥1 year. It is not approved for prophylaxis in children aged <1 year. However, CDC recommends that healthcare providers who treat children aged ≥3 months to <1 year administer a chemoprophylaxis dose of oseltamivir 3 mg/kg body weight/dose once daily. Chemoprophylaxis for infants aged <3 months <u>is not recommended</u> unless the exposure situation is judged to be critical.

<sup>b</sup> Zanamivir <u>is not recommended</u> for chemoprophylaxis in children aged <5 years or for children with underlying respiratory disease.

<sup>c</sup> See Fiore 2011 and Influenza Antiviral Medications: Summary for Clinicians for further details.

<sup>e</sup> Oseltamivir is FDA-approved for treatment of influenza in children aged ≥2 weeks; however, both CDC and AAP recommend use of oral oseltamivir for influenza treatment in infants aged <2 weeks.

<sup>f</sup> Zanamivir <u>is not recommended</u> for treatment in children aged <7 years or for children with underlying respiratory disease.

**Key to Acronyms:** AAP = American Academy of Pediatrics; CDC = Centers for Disease Control and Prevention; CrCl = creatinine clearance; ESRD = end stage renal disease; FDA = Food and Drug Administration; PK = pharmacokinetic
### Isosporiasis (Cystoisosporiasis)

*Last updated November 6, 2013; last reviewed November 6, 2013*

#### Dosing Recommendations for Prevention and Treatment of Isosporiasis (Cystoisosporiasis)

<table>
<thead>
<tr>
<th>Indication</th>
<th>First Choice</th>
<th>Alternative</th>
<th>Comments/Special Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Primary Prophylaxis</strong></td>
<td>There are no U.S. recommendations for primary prophylaxis of isosporiasis.</td>
<td>N/A</td>
<td>Initiation of cART to avoid advanced immunodeficiency may reduce incidence; TMP-SMX prophylaxis may reduce incidence.</td>
</tr>
</tbody>
</table>
| **Secondary Prophylaxis** | If Severe Immunosuppression: • Administer TMP-SMX 2.5 mg/kg body weight of TMP component twice daily by mouth 3 times per week | Pyrimethamine 1 mg/kg body weight (maximum 25 mg) plus folinic acid, 10–25 mg by mouth once daily.  
**Second-Line Alternative:** • Ciprofloxacin, 10–20 mg/kg body weight given twice daily by mouth 3 times per week | Consider discontinuing secondary prophylaxis in a patient receiving cART after sustained improvement from severe immunosuppression (from CDC immunologic category 3 to CD4 values that fall within category 1 or 2) for longer than 6 months. In adults, the dose of pyrimethamine for secondary prophylaxis (25 mg daily) is lower than the dose for treatment (50–75 mg daily), but no similar data exist for children. Thus, the recommended dosing for secondary prophylaxis in children is 1 mg/kg per dose (maximum 25 mg) once daily. Ciprofloxacin is generally not a drug of first choice in children due to increased incidence of adverse events, including events related to joints and/or surrounding tissues. |
| **Treatment**       | TMP-SMX 5 mg/kg body weight of TMP component given twice daily by mouth for 10 days | Pyrimethamine 1 mg/kg body weight plus folinic acid 10-25 mg by mouth once daily for 14 days  
**Second-Line Alternatives:** • Ciprofloxacin 10–20 mg/kg body weight/day twice daily by mouth for 7 days  
• Nitazoxanide (see doses below) for 3 consecutive days  
  • Children 1–3 years: 100 mg by mouth every 12 hours  
  • Children 4–11 years: 200 mg by mouth every 12 hours  
  • Adolescents ≥12 years and adults: 500 mg by mouth every 12 hours | If symptoms worsen or persist, the TMP-SMX dose may be increased to 5 mg/kg/day given 3–4 times daily by mouth for 10 days or the duration of treatment may be lengthened. Duration of treatment with pyrimethamine has not been well established. Ciprofloxacin is generally not a drug of first choice in children due to increased incidence of adverse events, including events related to joints and/or surrounding tissues. |

**Key to Acronyms:** CD4 = CD4 T lymphocyte; CDC = Centers for Disease Control and Prevention; cART = combination antiretroviral therapy; TMP-SMX = trimethoprim-sulfamethoxazole
### Malaria (Last updated November 6, 2013; last reviewed November 6, 2013)

#### Dosing Recommendations for Prevention and Treatment of Malaria

<table>
<thead>
<tr>
<th>Indication</th>
<th>First Choice</th>
<th>Comments/Special Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Primary Prophylaxis</strong></td>
<td><strong>For Travel To Chloroquine-Sensitive Areas:</strong></td>
<td>Recommendations are the same for HIV-infected and HIV-uninfected children. Please refer to the following website for the most recent recommendations based on region and drug susceptibility: <a href="http://www.cdc.gov/malaria/">http://www.cdc.gov/malaria/</a><em>&lt;br&gt;For travel to chloroquine-sensitive areas. Equally recommended options include chloroquine, atovaquone/proguanil, doxycycline (for children aged ≥8 years), and mefloquine; primaquine is recommended for areas with mainly <em>P. vivax</em>. G6PD screening must be performed prior to primaquine use.&lt;br&gt;Chloroquine phosphate is the only formulation of chloroquine available in the United States; 10 mg of chloroquine phosphate = 6 mg of chloroquine base.</em></td>
</tr>
<tr>
<td></td>
<td><strong>• Chloroquine base 5 mg/kg body weight base by mouth, up to 300 mg once weekly (equivalent to 7.5 mg/kg body weight chloroquine phosphate). Start 1–2 weeks before leaving, take weekly while away, and then take once weekly for 4 weeks after returning home</strong>&lt;br&gt;• Atovaquone/proguanil once daily started 1–2 days before travel, for duration of stay, and then for 1 week after returning home&lt;br&gt;  • 11–20 kg; 1 pediatric tablet (62.5 mg/25 mg)&lt;br&gt;  • 21–30 kg; 2 pediatric tablets (125 mg/50 mg)&lt;br&gt;  • 31–40 kg; 3 pediatric tablets (187.5 mg/75 mg)&lt;br&gt;  • &gt;40 kg; 1 adult tablet (250 mg/100 mg)&lt;br&gt;• Doxycycline 2.2 mg/kg body weight (maximum 100 mg) by mouth once daily for children aged ≥8 years. Must be taken 1–2 days before travel, daily while away, and then up to 4 weeks after returning&lt;br&gt;• Mefloquine 5 mg/kg body weight orally given once weekly (max 250 mg)</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>For Areas with Mainly <em>P. vivax</em></strong></td>
<td>For travel to chloroquine-resistant areas, preferred drugs are atovaquone/proguanil, doxycycline (for children aged ≥8 years) or mefloquine.</td>
</tr>

<table>
<thead>
<tr>
<th>Indication</th>
<th>First Choice</th>
<th>Comments/Special Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Secondary Prophylaxis</strong></td>
<td>For <em>P. vivax</em> or <em>P. ovale</em>: • Primaquine 0.5 mg/kg base (0.8 mg/kg salt) up to adult dose orally, daily for 14 days after departure from the malarious area</td>
<td>This regimen, known as PART, is recommended only for individuals who have resided in a malaria-endemic area for an extended period of time. Adult dose: 30 mg base (52.6 mg salt) orally, daily for 14 days after departure from the malarious area. <a href="http://wwwn.cdc.gov/travel/yellowbook/2012/chapter-3-infectious-diseases-related-to-travel/malaria.htm#1939">http://wwwn.cdc.gov/travel/yellowbook/2012/chapter-3-infectious-diseases-related-to-travel/malaria.htm#1939</a></td>
</tr>
</tbody>
</table>

### Treatment

| Uncomplicated *P. Falciparum* or Unknown Malaria Species (All Malaria Areas Except Those Listed as Chloroquine Sensitive) or Unknown Region: | Atovaquone-proguanil (pediatric tablets 62.5 mg/25 mg; adult tablets 250 mg/100 mg), dosed once daily: • 5–8 kg; 2 pediatric tablets for 3 days; • 9–10 kg; 3 pediatric tablets for 3 days; • 11–20 kg; 4 pediatric tablets or 1 adult tablet for 3 days; • 21–30 kg; 2 adult tablets for 3 days; • 31–40 kg; 3 adult tablets for 3 days; • >40 kg; 4 adult tablets for 3 days | For quine-based regimens, doxycycline or tetracycline should be used only in children aged ≥8 years. An alternative for children aged ≥8 years is clindamycin 7 mg/kg body weight per dose by mouth given every 8 hours. Clindamycin should be used for children aged <8 years. Before primaquine is given, G6PD status must be verified. Primaquine may be given in combination with chloroquine if the G6PD status is known and negative, otherwise give after chloroquine (when G6PD status is available) For most updated prevention and treatment recommendations for specific region, refer to updated CDC treatment table available at [http://www.cdc.gov/malaria/resources/pdf/treatmenttable.pdf](http://www.cdc.gov/malaria/resources/pdf/treatmenttable.pdf) For sensitive and resistant malaria map: [http://cdc-malaria.ncsa.uiuc.edu/](http://cdc-malaria.ncsa.uiuc.edu/) High treatment failure rates due to chloroquine-resistant *P. vivax* have been documented in Papua New Guinea and Indonesia. Treatment should be selected from one of the three following options: • Atovaquone-proguanil plus primaquine phosphate • Quinine sulfate plus EITHER doxycycline OR tetracycline PLUS primaquine phosphate. This regimen cannot be used in children aged <8 years. • Mefloquine plus primaquine phosphate |

| Uncomplicated *P. Falciparum* OR Unknown Malaria Species From Chloroquine-Sensitive Region (See Comments for Link to Resistance Map): | Chloroquine phosphate: 16.6 mg/kg body weight (10 mg/kg body weight chloroquine base) (maximum 1000 mg) by mouth once, then 8.3 mg/kg body weight (maximum 500 mg) by mouth at 6, 24, and 48 hours (total dose = 41.6 mg/kg body weight chloroquine phosphate [maximum 2500 mg] = 25 mg/kg body weight chloroquine base) | |

| *P. vivax*, *P. ovale*, *P. malariae*, *P. knowlesi* (All Areas Except Papua New Guinea, Indonesia; See Comments) | Chloroquine phosphate 16.6 mg/kg body weight (10 mg/kg body weight chloroquine base) (maximum 1000 mg) by mouth once, then 8.3 mg/kg body weight (maximum 500 mg) by mouth at 6, 24, and 48 hours (total dose = 41.6 mg/kg body weight chloroquine phosphate [maximum 2500 mg] = 25 mg/kg body weight chloroquine base) | |

| Initial Therapy (Followed by Anti-Relapse Therapy for *P. ovale* and *P. Vivax*): | Chloroquine phosphate 16.6 mg/kg body weight (10 mg/kg body weight chloroquine base) (maximum 1000 mg) by mouth once, then 8.3 mg/kg body weight (maximum 500 mg) by mouth at 6, 24, and 48 hours (total dose = 41.6 mg/kg body weight chloroquine phosphate [maximum 2500 mg] = 25 mg/kg body weight chloroquine base) | |

<p>| Anti-Relapse Therapy for <em>P. ovale</em>, <em>P. vivax</em>: | Primaquine 0.5 mg base/kg body weight (max 30 mg base) by mouth once daily for 14 days | |</p>

</table>
### Preventive Regimen

<table>
<thead>
<tr>
<th>Indication</th>
<th>First Choice</th>
<th>Alternative</th>
<th>Comments/Special Issues</th>
</tr>
</thead>
</table>
| Treatment  | **Initial Treatment (≥2 Drugs):**  
  • Clarithromycin 7.5–15 mg/kg body weight (maximum 500 mg/dose) orally twice daily **plus** ethambutol 15–25 mg/kg body weight (maximum 2.5 g/day) orally once daily followed by chronic suppressive therapy  
  For Severe Disease, Add:  
  • Rifabutin 10–20 mg/kg body weight (maximum 300 mg/day) orally once daily | **If Intolerant to Clarithromycin:**  
  • Azithromycin 10–12 mg/kg body weight (maximum 500 mg/day) orally once daily  
  **If Rifabutin Cannot Be Administered and a Third Drug is Needed in Addition to a Macrolide and Ethambutol, or if a Fourth Drug is Needed in Addition to Rifabutin for Patients with More Severe Symptoms or Disseminated Disease:**  
  • Ciprofloxacin 10–15 mg/kg orally twice daily (maximum 1.5 g/day), or  
  • Levofloxacin 500 mg orally once daily, or  
  • Amikacin 15–30 mg/kg body weight IV in 1 or 2 divided doses (maximum 1.5 g/day) | Combination therapy with a minimum of 2 drugs is recommended for ≥12 months.  
Clofazimine is associated with increased mortality in adults with HIV infection and should not be used.  
Children receiving ethambutol who are old enough to undergo routine eye testing should have monthly monitoring of visual acuity and color discrimination.  
Fluoroquinolones (e.g., ciprofloxacin and levofloxacin) are not labeled for use in children aged <18 years because of concerns regarding potential effects on cartilage; use in children aged <18 years requires an assessment of potential risks and benefits.  
Chronic suppressive therapy (secondary prophylaxis) is recommended in children and adults following initial therapy. |

*Some experts use twice-daily dosing of atovaquone as alternative treatment for PCP in children aged <12 years:
* Children aged 1–3 months and >24 months to 12 years: 15–20 mg/kg body weight/dose by mouth twice daily with food
* Children aged 4–24 months: 22.5 mg/kg body weight/dose by mouth twice daily with food.

**Key to Acronyms:** cART = combination antiretroviral therapy; CD4 = CD4 T lymphocyte cell; IM = intramuscular; IV = intravenous; PCP = Pneumocystis jirovecii pneumonia; TMP-SMX = trimethoprim-sulfamethoxazole

**Note:** Information included in these guidelines might not represent Food and Drug Administration (FDA) approval or approved labeling for products or indications. Specifically, the terms safe and effective might not be synonymous with the FDA-defined legal standards for product approval.

</tbody>
</table>
| Primary (Post-Exposure) Prophylaxis | VariZIG 125 IU/10 kg body weight IM (maximum 625 IU), administered ideally within 96 hours (potentially beneficial up to 10 days) after exposure | • If VariZIG cannot be administered within 96 hours (up to 10 days), IVIG 400 mg/kg body weight, administered once should be considered. IVIG should ideally be administered within 96 hours of exposure.  
• When passive immunization is not possible, some experts recommend prophylaxis with acyclovir 20 mg/kg body weight/dose (maximum dose 800 mg), administered QID for 7 days, beginning 7–10 days after exposure | Primary Post-Exposure Prophylaxis Indicated for:  
• Patients with substantial exposure to varicella or zoster with no verified history of varicella or zoster or who are seronegative for VZV on a sensitive, specific antibody assay or who lack evidence of vaccination. Many experts limit this recommendation to varicella or zoster-exposed HIV-infected children who are considered to be severely immunocompromised, (i.e., in CDC Immunologic Category 3), especially if also classified as CDC Clinical Category C\textsuperscript{a} and experiencing a high HIV RNA plasma viral load (BIII).  
• Some experts start acyclovir at first appearance of rash.  

**Note:** To obtain VariZIG, contact FFF Enterprises at 1-800-843-7477 or [http://www.fffenterprises.com](http://www.fffenterprises.com). |
| Secondary Prophylaxis             | N/A                           | N/A         | There is no indication for secondary prophylaxis                                         |

<tbody>
<tr>
<td><strong>Treatment</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Chickenpox</strong></td>
<td>Children with No or Moderate Immune Suppression (CDC Immunologic Categories 1 and 2) and Mild Varicella Disease:</td>
<td>Patients Unresponsive to Acyclovir:</td>
<td>In children ≥1 year of age, some experts base IV acyclovir dosing on body surface area (500 mg/m(^2) body surface area/dose IV every 8 hours) instead of body weight. Valacyclovir is approved for use in adults and adolescents with zoster at 1 g/dose by mouth TID for 7 days; the same dose has been used for varicella infections. Data on dosing in children are limited and there is no pediatric preparation, although 500 mg capsules can be extemporaneously compounded to make a suspension to administer 20 mg/kg body weight/dose (maximum dose 1 g) given TID (see prescribing information). Famciclovir is approved for use in adults and adolescents with zoster at 500 mg/dose by mouth TID for 7 days; the same dose has been used for varicella infections. There is no pediatric preparation and data on dosing in children are limited; can be used by adolescents able to receive adult dosing. Involvement of an ophthalmologist with experience in managing herpes zoster ophthalmicus and its complications in children is strongly recommended when ocular involvement is evident. Optimal management of PORN has not been defined.</td>
</tr>
<tr>
<td></td>
<td>• Acyclovir 20 mg/kg body weight/dose by mouth (max 800 mg/dose) QID for 7–10 days and until no new lesions for 48 hours</td>
